# Social Computing

INFO/CSE 100, Spring 2005  
Fluency in Information Technology

<http://www.cs.washington.edu/100>

# Readings and References

---

- Reading
  - » *Fluency with Information Technology*
    - Chapters 12

# Communicating over IT

---

- Synchronous communication
  - » Instant messaging
  - » Internet Relay Chat (IRC)
- Asynchronous communication
  - » Email
  - » Bulletin Boards
  - » UseNet news
  - » Blogs
  - » SMS

# Problems with Text Communication

---

- Conveying emotion
  - » Emoticons :-), :D, ^--^
- Too much emphasis ???
- Pace
- Ambiguity
  - » Sarcasm?!?
- Flame Wars
  - » Revenge of the Inconsolable Responder

# Email Netiquette

---

- Only discuss 1 topic at a time
- Use a descriptive subject line
- Limit size and type of attachments
- Don't forward SPAM
- Use vacation messages (automated replies)
- Avoid mass mailing (use group aliases)
- Answer your email from the most current to the least current

# Internet Netiquette

---

- Moderation
  - » And administrative or authoritative person who listens and/or approves communication
- <http://www.dtcc.edu/cs/rfc1855.html>
  - » Email
  - » Usenet
  - » Chat

# Passwords

---

- Passwords are used to limit computer or software access
  - Should be changed on a periodic basis (every 90 days at the UW)
  - Forgotten passwords?!?
    - » As the administrator to reset it for you
  - Select password topic areas
  - Encode password with alternative characters
-

# Intellectual Property

---

- Software licenses
  - » use
  - » shareware
  - » freeware
- Copyright gives the owner the right to:
  - Make a copy of the work
  - Use for a derivate work
  - Distribute or publish
  - Publicly perform/display

# Why Study Databases?

- Some of us want to compute, but all of us want information ...
  - Much of the archived information is in tables
  - Databases enhance applications, e.g. Web
  - Once you know how to create databases, you can use them to personal advantage
  - Databases introduce interesting ideas

## The Internet Movie Database

Visited by over 20 million movie lovers each month!

Welcome to the Internet Movie Database, the biggest, best, most award-winning movie site on the planet.

# How to organize the data?

---

- Before relational databases (the kind we study) there were only “flat files”
  - » Structural information is difficult to express
  - » All processing of information is “special cased”
    - custom programs are needed
  - » Information repeated; difficult to combine
  - » Changes in format of one file means all programs that ever process that file must be changed
    - eg, adding ZIP codes

# tab-delimited file example

## Download of Variation Data (Single File )

### [Global Prettybase Files](#)

This is a tab delimited text file in our "prettybase" format, which describes all SNP sites discovered by the SeattleSNPs PGA. The format of this file is:

Line format:

```
<chromosome position-chromosome-HUGO_NAME > <PGA Sample ID> <Allele1>
<Allele2>
```

Example: 74772592-10-PLAU D001 G T

The 'chromosome position' is generated from mapping to the most recent genome assembly available from the [UCSC Genome Assembly](#)

```
1100322-IL3RA-X      D001      N      N
1100322-IL3RA-X      D002      G      G
1100322-IL3RA-X      D003      G      G
1100322-IL3RA-X      D004      G      G
1100322-IL3RA-X      D005      G      G

# Unix termcap example

---

```
# FILE FORMAT:
#
# The version you are looking at may be in any of three formats: master
# (terminfo with OT capabilities), stock terminfo, or termcap. You can
# tell
# which by the format given in the header above.
#
# The master format is accepted and generated by the terminfo tools in the
# ncurses suite; it differs from stock (System V-compatible) terminfo only
# in that it admits a group of capabilities (prefixed `OT') equivalent to
# various obsolete termcap capabilities.
...
# ANSI capabilities are broken up into pieces, so that a terminal
# implementing some ANSI subset can use many of them.

from Access Database book, Steve Roman

# Relational Databases

---

- Information is stored in tables
  - » Tables store information about *entities*
  - » Entities have characteristics called *attributes*
  - » Each row in a table represents a single entity
    - Each row is a set of attribute values
    - Every row must be unique, identified by a key
  - » Relationships -- associations among the data values are stored

Table structure = schema  
Table contents = instance

# A Table in a Database

Tables have names, attributes, rows

ID	Last	First	JobID	Hire	Street	City	State	Country
1	Davalino	Nancy	0	5/1/1992	507 20th Ave E	Seattle	WA	USA
2	Fuller	Andrew	3	8/14/1992	908 W. Capital Way	Seattle	WA	USA
3	Wooster	Berton	1	4/1/1993	722 Moss Bay Blvd	Seattle	WA	USA
4	Peacock	Margaret	2	5/3/1993	4110 Old Redmond Rd	Kirkland	WA	USA

# Redundancy in a database is Very Bad

- Not every assembly of tables is a good database
- Repeating data is a bad idea
  - » Replicated data can differ in its different locations, e.g. multiple addresses can differ
    - Inconsistent data is worse than no data
  - » Keep a *single copy* of any data
    - if it is needed in multiple places, associate it with a key and store key rather than the data

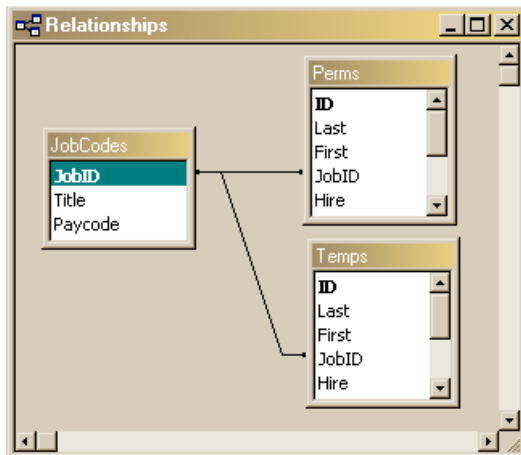

# Relationships between tables

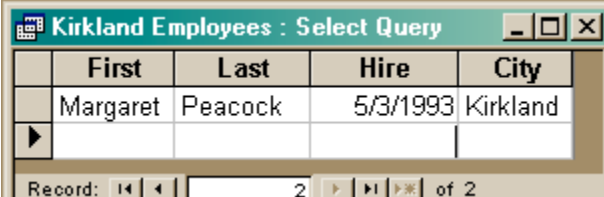

ID	Last	First	JobID	Hire	Street	City	State	Country
1	Davalino	Nancy	0	01-May-92	507 20th Ave E	Seattle	WA	USA

# Relational Algebra: Tables From Tables

There are five basic “algebraic” operations on tables:

- Select -- pick rows from a table
- Project -- pick columns from a table
- Union -- combine two tables w/like columns
- Difference -- remove one table from another
- Product -- create “all pairs” from two tables

From this basis, many more complicated operations can be built up
