F-1

Overview

Concepts this lecture

- Conditional execution
- if statement
- Conditional expressions
- Relational and logical operators
- {Compound statements}

F-2

Related Reading

Read Sections 4.1-4.5, 4.7-4.9

- 4.1: Control structure preview
- 4.2: Relational and logical operators
- 4.3: if statements
- 4.4: Compound statements
- 4.5: Example
- 4.7: Nested if statements

F-3

Control Flow

“Control flow” is the order in which statements are executed

Until now, control flow has been sequential – the next statement executed is the next one that appears, in order, in the C program

F-4

Conditional Control Flow

choosing which of two (or more) statements to execute before continuing

choosing whether or not to skip a statement before continuing

F-5

Conditional Execution

A **conditional statement** allows the computer to **choose** an execution path depending on the value of a variable or expression

- if the withdrawal is more than the bank balance, **then** print an error
- if today is my birthday, **then** add one to my age
- if using whole milk, **then** add two eggs, **otherwise** add three eggs

F-6

Conditional ("if") Statement

```
if (condition) {  
    statement;  
}
```

The **statement** is executed if and only if the **condition** is true.

```
if (withdrawalAmount > balance) {  
    printf("Not enough money\n");  
}  
if (temperature > 98.6) {  
    printf("You have a fever.\n");  
}  
if (x < 100) {  
    x = x + 1;  
}
```

F-7

Conditional Flow Chart

```
if (x < 100) {  
    x = x + 1;  
}  
y = y + 1;
```

F-8

Conditions

In parentheses is a condition, also called a "logical" or "Boolean" expression

Made up of variables, constants, arithmetic expressions, and the relational operators

Math symbols: <, ≤, >, ≥, =, ≠
in C: <, <=, >, >=, ==, !=

F-9

Conditional Expressions

```
air_temperature > 80.0  
98.6 <= body_temperature  
marital_status == 'M'  
divisor != 0
```

Such expressions are used in "if" statements and numerous other places in C.

F-10

Value of Conditional Expressions

What is the value of a conditional expression??

Answer: we think of it as **TRUE** or **FALSE**

Under the hood in C, it's really an integer

FALSE is 0 (and 0 is FALSE)

TRUE is any value other than 0

(and non-zero is TRUE)

1 is the result of a true relational operator^{F-11}

(e.g., 4 < 7 evaluates to 1)

Complex Conditionals

if I have at least \$15 **or** you have at least \$15, then we can go to the movies

if the temperature is below 32 degrees **and** it's raining, then it's snowing

if it's **not** the case that it's Saturday or Sunday, then it's a work day

F-12

Complex Conditionals in C

We use Boolean operators to code complex conditionals in C.

We'll say lots more about this later! For now, here is some information for reference.

Boolean operators	&&		!
	and	or	not

#define	TRUE	1
#define	FALSE	0

```
if (myMoney >= 15.0 || yourMoney >= 15.0) {
    canGoToMovies = TRUE;
}
```

F-13

Multiple Actions

What if there's more than one conditional action?

"If your temperature is high, then you have a fever and should take two aspirin and go to bed and call in sick tomorrow"

F-14

Compound Statement

Groups together statements so that they are treated as a single statement:

```
{
    statement1;
    statement2;
    ...
}
```

Also called a "block."

Highly useful

Not just in conditionals, but many places in C

F-15

Using a Compound Statement

```
if (temperature > 98.6) {
    printf("You have a fever. \n");
    aspirin = aspirin - 2;
    printf("Go to bed\n");
    printf("Sleep in tomorrow\n");
}
```

F-16

Combining and Substituting Statements

You may use a compound statement **anywhere** that a single statement may be used

Anywhere that a statement is allowed in C, **any kind** of statement can be used

A compound statement can contain **any number** of statements (including 0)

Among other things, these principles imply that compound statements can be nested to any depth

F-17

Another Compound Example

Cash machine program fragment:

```
if (balance >= withdrawal) {
    balance = balance - withdrawal;
    dispense_funds(withdrawal);
}
```

What if {} omitted?

What if {} omitted?

F-18

Finding Absolute Value

Problem: Compute the absolute value $|x|$ of x and put the answer in variable *abs*. Here are three solutions, all correct:

```
if (x >= 0) {           abs = x;
  abs = x;              if (x < 0) {
}                       abs = -x;
if (x < 0) {           }
  abs = -x;
}
```

```
if (x >= 0) {
  abs = x;
} else {
  abs = -x;
}
```

F-19

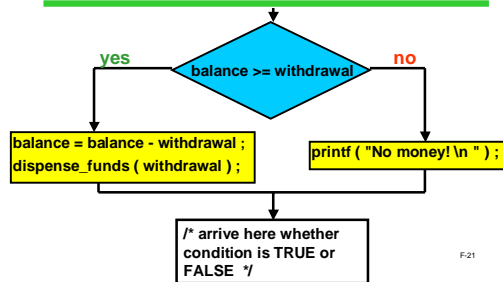

if - else

Print error message only if the condition is false:

```
if (balance >= withdrawal) {
  balance = balance - withdrawal ;
  dispense_funds ( withdrawal ) ;
}
else {
  printf ( "Insufficient Funds! \n " );
}
```

F-20

if-else Control Flow

F-21

Nested if Statements

```
#define BILL_SIZE 20
if ( balance >= withdrawal ) {
  balance = balance - withdrawal ;
  dispense_funds ( withdrawal ) ;
} else {
  if ( balance >= BILL_SIZE ) {
    printf ( "Try a smaller amount. \n " );
  } else {
    printf ( "Go away! \n " );
  }
}
```

F-22

Nested ifs , Part II

```
if ( x == 5 ) {
  if ( y == 5 ) {
    printf ( "Both are 5. \n " );
  } else {
    printf ( "x is 5, but y is not. \n " );
  }
} else {
  if ( y == 5 ) {
    printf ( "y is 5, but x is not. \n " );
  } else {
    printf ( "Neither is 5. \n " );
  }
}
```

F-23

Tax Table Example

Problem: Print the % tax based on income:

income	tax
< 15,000	0%
15,000, < 30,000	18%
30,000, < 50,000	22%
50,000, < 100,000	28%
100,000	31%

F-24

Direct Solution

```
if ( income < 15000 ) {
    printf( "No tax." );
}
if ( income >= 15000 && income < 30000 ) {
    printf("18% tax.");
}
if ( income >= 30000 && income < 50000 ) {
    printf("22% tax.");
}
if ( income >= 50000 && income < 100000 ) {
    printf("28% tax.");
}
if ( income >= 100000 ) {
    printf("31% tax.");
}
```

Mutually exclusive conditions - only one will be true

F-26

Cascaded ifs

```
if ( income < 15000 ) {
    printf( "No tax" );
} else {
    if ( income < 30000 ) {
        printf( "18% tax." );
    } else {
        if ( income < 50000 ) {
            printf( "22% tax." );
        } else {
            if ( income < 100000 ) {
                printf( "28% tax." );
            } else {
                printf( "31% tax." );
            }
        }
    }
}

if ( income < 15000 ) {
    printf( "No tax." );
} else if ( income < 30000 ) {
    printf( "18% tax." );
} else if ( income < 50000 ) {
    printf( "22% tax." );
} else if ( income < 100000 ) {
    printf( "28% tax." );
} else {
    printf( "31% tax." );
}
```

Order is important. Conditions are evaluated in order given.

F-26

Warning: Danger Ahead

The idea of conditional execution is natural, intuitive, and highly useful

However...

Programs can get convoluted and hard to understand

There are syntactic pitfalls to avoid

F-27

Pitfalls of if, Part I

```
if ( x == 10 ) {
    printf( "x is 10 " );
}
```

Bug! = is used instead of ==

This is not a syntax error, so the compiler will not report any errors and the program can execute

F-28

The World's Last C Bug

```
status = check_radar ( );
if (status = 1) {
    launch_missiles ( );
}
```

F-29

Pitfalls of if, Part II

No:

```
if ( 0 <= x <= 10 ) {
    printf ( "x is between 0 and 10. \n " );
}
```

Yes:

```
if ( 0 <= x && x <= 10 ) {
    printf ( "x is between 0 and 10. \n " );
}
```

F-30

Pitfalls of if, Part III

& is different from **&&**
| is different from **||**

& and **|** are not used in this class, but are legal C
If used by mistake, **no syntax error**, but program may
produce bizarre results

F-31

Pitfalls of if, Part IV

Beware **==** and **!=** with doubles:

```
double x ;  
x = 30.0 * (1.0 / 3.0) ;  
if ( x == 10.0 ) ...
```

F-32

Next Time

We'll be discussing functions, a major topic
of the course

Many students find it intellectually
challenging compared to the previous
material

F-33
