**CSE 142**

**2-D Arrays**

---

2/27/2002 (c) 2001-2, University of Washington S-1

## Introduction

---

- **Review:**
  - Simple, one-dimensional arrays
- **Today:**
  - Two-dimensional arrays
- **Reading**
  - Dugan notes: ch. 20

---

2/27/2002 (c) 2001-2, University of Washington S-2

## Review – Arrays

---

- **Simple, ordered collections.**
- **Elements of a particular array all have the same type.**
- **Size fixed when array created.**

```
Rectangle[] rects = new Rectangle[42+17];
```
- **Indexed access to elements.**

```
rects[3] = new Rectangle();
rects[3].moveBy(10, 20);
```

---

2/27/2002 (c) 2001-2, University of Washington S-3

## 2-D Arrays

---

- **Suppose we want to represent a picture.**  
(Disclaimer: simple-minded representation for lecture purposes.)
- **Want a rectangular, 2-dimensional matrix of colored Rectangles, each of size 1x1.**
- **We can create an array with 2 dimensions to hold the picture.**
  - **Type pattern:** `<elem type>[ ][ ]`
  - **New expr pattern:** `new <elem type>[<dim 1 size>][<dim 2 size>]`
  - **Access expr/assignment pattern:** `<array>[<dim 1 index>][<dim 2 index>]`

```
Rectangle[ ][ ] picture = new Rectangle [40] [60];
picture[0][0] = new Rectangle(0,0,1,1, Color.blue, true);
```

---

## 2-D Array = Array of Arrays

---

- **A 2-D array is really just an array of arrays.**  
(In languages like FORTRAN and C/C++, this isn't true.)
- **It's possible to manipulate each row array separately.**
  - **(Draw the picture!)**

```
Rectangle[ ][ ] picture = new Rectangle[40][60];
picture[0][0] = new Rectangle(0,0,1,1, Color.blue, true);
...
Rectangle[] firstRow = picture[0];
firstRow[0] = new Rectangle(0,0,1,1, Color.red, true);
```
- **What do the following evaluate to?**

```
picture.length
firstRow.length
picture[0][0].length
```

---

2/27/2002 (c) 2001-2, University of Washington S-5

## Collections of Collections

---

- **Arrays of arrays are just a special case of allowing collections to hold any kind of object, including another collection.**
- **If more convenient, we could have used ArrayLists whose elements were ArrayLists to represent the picture.**

---

2/27/2002 (c) 2001-2, University of Washington S-6

## 2-D Array Traversal

- Typical traversal is to go through the rows and, for each row, go through the columns. Called "row-major order".

```
public void initialize(Rectangle[] [] picture, Color initialColor) {
    for (int row = 0; row < picture.length; row++) {
        for (int col = 0; col < picture[row].length; col++) {
            picture[row][col] = new Rectangle(col,row,1,1,initialColor,true);
        }
    }
}
```

- Notice how the upper bounds of the two loops are computed.

## Exercise: Shift Picture to Left

*// Copy colors one cell to the left, setting last column to white*  
 public void shiftLeft(Rectangle[] [] picture) {

```
    for (int row = 0; row < picture.length; row++) {
        for (int col = 0; col < picture[row].length - 1; col++) {
            Rectangle thisPixel = picture[row][col];
            Rectangle pixelToRight = picture[row][col+1];
            thisPixel.setColor(pixelToRight.getColor());
        }
        picture[row][picture[row].length-1].setFillColor(Color.WHITE);
    }
}
```

S-8

## Exercise: Shift Picture Down

*// Copy colors one cell downwards, setting first row to white*  
 public void shiftDown(Rectangle[] [] picture) {

```
}
```

- Hint: row-major order might not be the right approach.
