

Linearity of Expectation

CSE 312 Spring 21
Lecture 12

Expectation

Expectation

The “expectation” (or “expected value”) of a random variable X is:

$$\mathbb{E}[X] = \sum_k k \cdot \mathbb{P}(X = k) \quad \leftarrow$$

Intuition: The weighted average of values X could take on.

Weighted by the probability you actually see them.

Linearity of Expectation

Linearity of Expectation

For any two random variables X and Y :

$$\mathbb{E}[X + Y] = \mathbb{E}[X] + \mathbb{E}[Y]$$

Note: X and Y do not have to be independent

Extending this to n random variables, X_1, X_2, \dots, X_n ←

$$\mathbb{E}[X_1 + X_2 + \dots + X_n] = \mathbb{E}[X_1] + \mathbb{E}[X_2] + \dots + \mathbb{E}[X_n] \leftarrow$$

This can be proven by induction.

$$\mathbb{E}\left[\sum_{i=1}^n X_i\right] = \sum_{i=1}^n \mathbb{E}[X_i]$$

Linearity of Expectation - Proof

Linearity of Expectation

For any two random variables X and Y :

$$\mathbb{E}[X + Y] = \mathbb{E}[X] + \mathbb{E}[Y]$$

Note: X and Y do not have to be independent

$$\begin{aligned} \mathbb{E}[aX + bY] &= \sum_{\omega} P(\omega) (X(\omega) + Y(\omega)) \\ &= \sum_{\omega} P(\omega) X(\omega) + \sum_{\omega} P(\omega) Y(\omega) \\ &= \mathbb{E}[aX] + \mathbb{E}[bY] \\ &= a \mathbb{E}[X] + b \mathbb{E}[Y] \end{aligned}$$

Linearity of Expectation

Linearity of Expectation

For any two random variables X and Y :

$$\mathbb{E}[X + Y] = \mathbb{E}[X] + \mathbb{E}[Y]$$

More generally, for random variables X and Y and scalars a, b and c :

$$\mathbb{E}[aX + bY + c] = a\mathbb{E}[X] + b\mathbb{E}[Y] + c$$

$$\mathbb{E}[k] = k$$

Fishy Business

Say you and your friend go fishing everyday.

- You catch X fish, with $\mathbb{E}[X] = 3$
- Your friend catches Y fish, with $\mathbb{E}[Y] = 7$

10

- How many fish do both of you bring on an average day?

Z as the r.v. representing # of fish you both bring in

$$E[Z] = E[X + Y] = E[X] + E[Y] = 3 + 7 = \underline{\underline{10}}$$

Fishy Business

Say you and your friend go fishing everyday.

- You catch X fish, with $\mathbb{E}[X] = 3$
- Your friend catches Y fish, with $\mathbb{E}[Y] = 7$
- How many fish do both of you bring on an average day?

Let Z be the r.v. representing the total number of fish you both catch

$$\mathbb{E}[Z] = \mathbb{E}[X + Y] = \mathbb{E}[X] + \mathbb{E}[Y] = 3 + 7 = 10$$

Fishy Business

Say you and your friend go fishing everyday.

- You catch X fish, with $\mathbb{E}[X] = 3$
- Your friend catches Y fish, with $\mathbb{E}[Y] = 7$

- How many fish do both of you bring on an average day?

Let Z be the r.v. representing the total number of fish you both catch

$$\mathbb{E}[Z] = \mathbb{E}[X + Y] = \mathbb{E}[X] + \mathbb{E}[Y] = 3 + 7 = 10$$

- You can sell each for \$10, but you need \$15 for expenses. What is your average profit?

$$\mathbb{E}[10 \cdot Z - 15] = 10 \mathbb{E}[Z] - 15 = 10 \cdot 10 - 15 = 100 - 15 = \underline{\underline{85}}$$

Fishy Business

Say you and your friend go fishing everyday.

- You catch X fish, with $\mathbb{E}[X] = 3$
- Your friend catches Y fish, with $\mathbb{E}[Y] = 7$

- How many fish do both of you bring on an average day?

Let Z be the r.v. representing the total number of fish you both catch

$$\mathbb{E}[Z] = \mathbb{E}[X + Y] = \mathbb{E}[X] + \mathbb{E}[Y] = 3 + 7 = 10$$

- You can sell each for \$10, but you need \$15 for expenses. What is your average profit?

$$\mathbb{E}[10Z - 15] = 10\mathbb{E}[Z] - 15 = 100 - 15 = 85$$

Coin Tosses

If we flip a coin twice, what is the expected number of heads that come up?

$X \rightarrow$ # of heads that come up.

$$P_X(x) = \begin{cases} \frac{1}{4} & x = 0 \\ \frac{1}{2} & x = 1 \\ \frac{1}{4} & x = 2 \end{cases}$$

$$E[X] = \frac{1}{4} \cdot 0 + \frac{1}{2} \cdot 1 + \frac{1}{4} \cdot 2 = \underline{\underline{1}}$$

Coin Tosses

If we flip a coin twice, what is the expected number of heads that come up?

Let X be the r.v. representing the total number of heads

$$p_X(x) = \begin{cases} \frac{1}{4} & \text{if } x = 0 \\ \frac{1}{2} & \text{if } x = 1 \\ \frac{1}{4} & \text{if } x = 2 \end{cases}$$

Coin Tosses

If we flip a coin twice, what is the expected number of heads that come up?

Let X be the r.v. representing the total number of heads

$$p_X(x) = \begin{cases} \frac{1}{4} & \text{if } x = 0 \\ \frac{1}{2} & \text{if } x = 1 \\ \frac{1}{4} & \text{if } x = 2 \end{cases}$$

$$\mathbb{E}[X] = \sum_{\omega} P(\omega)X(\omega) = \frac{1}{4} \cdot 0 + \frac{1}{2} \cdot 1 + \frac{1}{4} \cdot 2 = \mathbf{1}$$

Repeated Coin Tosses

Now what if the probability of flipping a heads was p and that we wanted to find the total number of heads flipped when we flip the coin n times?

If Y is the r.v. representing the total number of heads that come up.

$$\begin{aligned}\mathbb{E}[Y] &= \sum_{k=0}^n k \cdot \mathbb{P}(Y = k) = \sum_{k=0}^n k \cdot \binom{n}{k} p^k (1-p)^{n-k} \\ &= \sum_{k=1}^n k \cdot \binom{n}{k} p^k (1-p)^{n-k}\end{aligned}$$

Repeated Coin Tosses

Now what if the probability of flipping a heads was p and that we wanted to find the total number of heads flipped when we flip the coin n times?

$$\begin{aligned}\mathbb{E}[Y] &= \sum_{k=0}^n k \cdot \mathbb{P}(Y = k) = \sum_{k=0}^n k \cdot \binom{n}{k} p^k (1-p)^{n-k} \\ &= \sum_{k=1}^n k \cdot \binom{n}{k} p^k (1-p)^{n-k} \\ &= np \sum_{k=1}^n \binom{n-1}{k-1} p^{k-1} (1-p)^{n-k} \quad \left[k \binom{n}{k} = n \binom{n-1}{k-1} \right] \\ &= np \sum_{i=0}^{n-1} \binom{n-1}{i} p^i (1-p)^{n-1-i} \\ &= np(p + (1-p))^{n-1} = \overline{np}\end{aligned}$$

Indicator Random Variables

For any event A , we can define the indicator random variable X for A

$$\underline{X} = \begin{cases} 1 & \text{if event } A \text{ occurs} \\ 0 & \text{otherwise} \end{cases}$$

$$\begin{aligned} \mathbb{P}(X = 1) &= \mathbb{P}(A) \\ \mathbb{P}(X = 0) &= 1 - \mathbb{P}(A) \end{aligned}$$

Repeated Coin Tosses (contd)

The probability of flipping a heads is p and we wanted to find the total number of heads flipped when we flip the coin n times?

$X \rightarrow$ # of head flipped

$$E[X] = E\left[\sum_{i=1}^n X_i\right]$$

$X_i = \begin{cases} 1 & \text{if the } i\text{th flip is heads} \\ 0 & \text{otherwise} \end{cases}$

$$= \sum_{i=1}^n E[X_i]$$

$$X = X_1 + X_2 + \dots + X_n$$

$$\begin{array}{ccccccc} \uparrow & \uparrow & & & & & \\ 1 & + & 0 & + & 0 & + & 0 \dots + 0 \end{array}$$

$$E[X_i] = p$$

$$\rightarrow \sum_{i=1}^n p$$

$$= \underline{\underline{1}}$$

$$= \underline{\underline{np}}$$

Repeated Coin Tosses (contd)

The probability of flipping a heads is p and we wanted to find the total number of heads flipped when we flip the coin n times?

Let X be the total number of heads

Let us define X_i as follows:

$$X_i = \begin{cases} 1 & \text{if the } i\text{th coin flip is heads} \\ 0 & \text{otherwise} \end{cases}$$

$$\begin{aligned} \mathbb{P}(X_i = 1) &= p \\ \mathbb{P}(X_i = 0) &= 1 - p \end{aligned}$$

$$\mathbb{E}[X_i] = 1 \cdot p + 0 \cdot (1 - p)$$

Repeated Coin Tosses (contd)

The probability of flipping a heads is p and we wanted to find the total number of heads flipped when we flip the coin n times?

Let X be the total number of heads

Let us define X_i as follows:

$$X_i = \begin{cases} 1 & \text{if the } i\text{th coin flip is heads} \\ 0 & \text{otherwise} \end{cases}$$

$$\begin{aligned} \mathbb{P}(X_i = 1) &= p \\ \mathbb{P}(X_i = 0) &= 1 - p \end{aligned}$$

$$\mathbb{E}[X_i] = 1 \cdot p + 0 \cdot (1 - p)$$

By Linearity of Expectation,

$$\mathbb{E}[X] = \mathbb{E}\left[\sum_{i=1}^n X_i\right] = \sum_{i=1}^n \mathbb{E}[X_i] = \mathbb{E}[X_1] + \mathbb{E}[X_2] + \cdots + \mathbb{E}[X_n] = np$$

Computing complicated expectations

We often use these three steps to solve complicated expectations

1. Decompose: Finding the right way to decompose the random variable into sum of simple random variables

$$X = \underbrace{X_1 + X_2 + \dots + X_n}$$

2. LOE: Apply Linearity of Expectation

$$\mathbb{E}[X] = \mathbb{E}[X_1] + \mathbb{E}[X_2] + \dots + \mathbb{E}[X_n]$$

3. Conquer: Compute the expectation of each X_i , $\mathbb{E}[X_i]$

Often X_i are indicator random variables

Pairs with the same birthday

$$\binom{m}{2}$$

In a class of m students, on average how many pairs of people have the same birthday?

X \rightarrow # of pairs of students with the same birthday

Decompose:

$$X_{ij} = \begin{cases} 1 & \text{if students } i \& j \text{ have the same birthday} \\ 0 & \text{otherwise} \end{cases} \quad \left[1 - \binom{m}{2} \right]$$

LOE:

$$X = \sum_{i \neq j} \binom{m}{2} X_{ij} \quad E[X] = E\left[\sum_j X_{ij}\right] = \sum_{ij} E[X_{ij}]$$

Conquer:

$$E[X_{ij}] = P(X_{ij} = 1) = \frac{\frac{365}{365} \cdot \frac{1}{365}}{\frac{365}{365} \cdot \frac{365}{365}} = \frac{1}{365} \quad \uparrow = \binom{m}{2} \frac{1}{365}$$

Pairs with the same birthday

In a class of m students, on average how many pairs of people have the same birthday?

Decompose: Let us define X as the number of pairs with the same birthday

Let us define X_{ij} as follows:

$$X_{ij} = \begin{cases} 1 & \text{if the } i, j \text{ have the same birthday} \\ 0 & \text{otherwise} \end{cases} \quad X = \sum_{i,j} \binom{m}{2} X_{ij}$$

LOE:

$$\mathbb{E}[X] = \sum_{i,j} \binom{m}{2} \mathbb{E}[X_{ij}]$$

Conquer:

$$\mathbb{E}[X_{ij}] = P(X_{ij} = 1) = \frac{365}{365 \cdot 365} = \frac{1}{365}$$
$$\mathbb{E}[X] = \binom{m}{2} \cdot \mathbb{E}[X_{ij}] = \binom{m}{2} \cdot \frac{1}{365}$$

Rotating the table

n people are sitting around a circular table. There is a name tag in each place. Nobody is sitting in front of their own name tag.

Rotate the table by a random number k of positions between 1 and $n-1$ (equally likely)

X is the number of people that end up in front of their own name tag. Find $\mathbb{E}[X]$.

Decompose:

$$X_i = \begin{cases} 1 & \text{if the } i\text{th person end up in front of} \\ & \text{their own name tag} \\ 0 & \text{otherwise} \end{cases}$$

LOE:

$$E[X] = \sum_{i=1}^n E[X_i] = \sum_{i=1}^n \frac{1}{n-1} = \frac{n}{n-1}$$

Conquer:

$$E[X_i] = P(X_i = 1) = \frac{1}{n-1}$$

$$X = \sum_{i=1}^n X_i$$

LOE:

$$\mathbb{E}[X] = \sum_{i=1}^n \mathbb{E}[X_i]$$

Conquer:

$$\mathbb{E}[X_i] = P(X_i = 1) = \frac{1}{n-1}$$

$$\mathbb{E}[X] = n \cdot \mathbb{E}[X_i] = \frac{n}{n-1}$$

Frogger

A frog starts on a 1-dimensional number line at 0. At each second, independently, the frog takes a unit step right with probability p_R to the left with probability p_L and doesn't move with probability p_S where $p_R + p_L + p_S = 1$. After 2 seconds, let X be the location of the frog. Find $\mathbb{E}[X]$.

$$\begin{aligned} E[X] &= E[X_1 + X_2] \\ &= E[X_1] + E[X_2] \\ &= 2(P_R - P_L) \end{aligned}$$

$$X = \underline{X_1} + \underline{X_2}$$

$$\begin{aligned} E[X_i] &= 1 \cdot P_R \\ &\quad + 0 \cdot P_S \\ &\quad + (-1) P_L \\ &= (P_R - P_L) \end{aligned}$$

$$\underline{X_i} = \begin{cases} 1 \\ -1 \\ 0 \end{cases}$$

if at i frog moves right
" " " " " left
otherwise

Frogger – Brute Force

A frog starts on a 1-dimensional number line at 0. At each second, independently, the frog takes a unit step right with probability p_R , to the left with probability p_L , and doesn't move with probability p_S , where $p_L + p_R + p_S = 1$. After 2 seconds, let X be the location of the frog. Find $\mathbb{E}[X]$.

$$p_X(x) = \begin{cases} p_L^2 & x = -2 \\ 2p_L p_S & x = -1 \\ 2p_L p_R + p_S^2 & x = 0 \\ 2p_R p_S & x = 1 \\ p_R^2 & x = 2 \\ 0 & \text{otherwise} \end{cases}$$

100 / 1000

$$\mathbb{E}[X] = \sum_{\omega} P(\omega)X(\omega) = (-2)p_L^2 + (-1)2p_L p_S + 0 \cdot (2p_L p_R + p_S^2) + (1)2p_R p_S + (2)p_R^2 = 2(p_R - p_L)$$

Frogger – LOE

A frog starts on a 1-dimensional number line at 0. At each second, independently, the frog takes a unit step right with probability p_R , to the left with probability p_L , and doesn't move with probability p_S , where $p_L + p_R + p_S = 1$. After 2 seconds, let X be the location of the frog. Find $\mathbb{E}[X]$.

Let us define X_i as follows:

$$X_i = \begin{cases} -1 & \text{if the frog moved left on the } i\text{th step} \\ 0 & \text{otherwise} \\ 1 & \text{if the frog moved right on the } i\text{th step} \end{cases}$$

$$\mathbb{E}[X_i] = -1 \cdot p_L + 1 \cdot p_R + 0 \cdot p_S = (p_R - p_L)$$

By Linearity of Expectation,

$$\mathbb{E}[X] = \mathbb{E}\left[\sum_{i=1}^2 X_i\right] = \sum_{i=1}^2 \mathbb{E}[X_i] = 2(p_R - p_L)$$
