# CSE 312 Foundations of Computing II

Lecture 14: Expectation & Variance of Continuous RVs Exponential and Normal Distributions

### Announcements

- See EdStem posts related to next week's midterm on Nov 2 in class:
  - Midterm General Information
  - Midterm Review (including Practice Midterm)
  - Practice Midterm and other Solutions
- The class after ours has a midterm the same day so we will need to finish at 2:20 sharp.
  - I talked with Prof. Anderson who offered to finish CSE 332 a few minutes early next Wednesday.
- Midterm Q&A session next Tuesday 4pm on Zoom

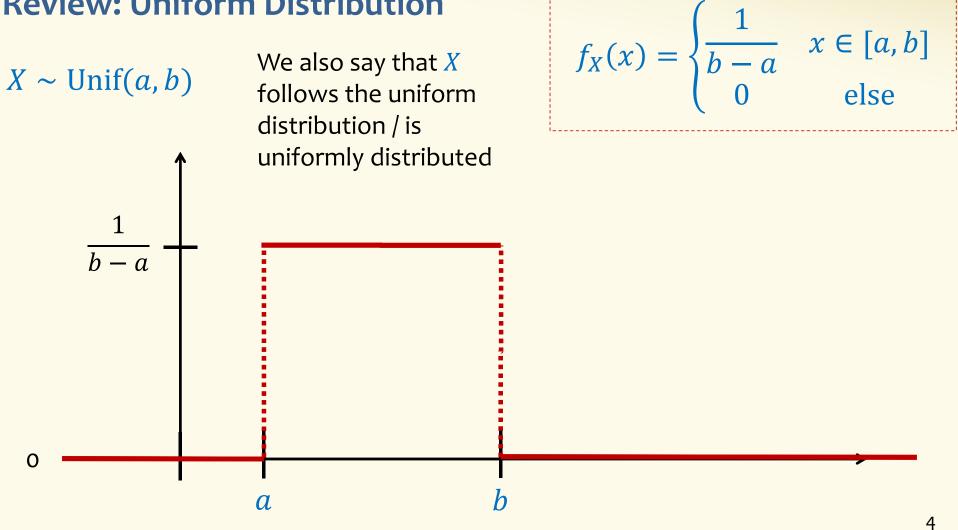

### **Review – Continuous RVs**

$$P(X \in [a, b]) = \int_{a}^{b} f_{X}(x) dx$$
$$= F_{X}(b) - F_{X}(a)$$

$$F_X(y) = P(X \le y)$$

# **Review: Uniform Distribution**

# **Review: From Discrete to Continuous**

	Discrete	Continuous
PMF/PDF	$p_X(x) = P(X = x)$	$f_X(x) \neq P(X = x) = 0$
CDF	$F_X(x) = \sum_{t \le x} p_X(t)$	$F_X(x) = \int_{-\infty}^x f_X(t)  dt$
Normalization	$\sum_{x} p_X(x) = 1$	$\int_{-\infty}^{\infty} f_X(x)  dx = 1$
Expectation	$\mathbb{E}[g(X)] = \sum_{x} g(x) p_X(x)$	$\mathbb{E}[g(X)] = \int_{-\infty}^{\infty} g(x) f_X(x) dx$

## **Expectation of a Continuous RV**

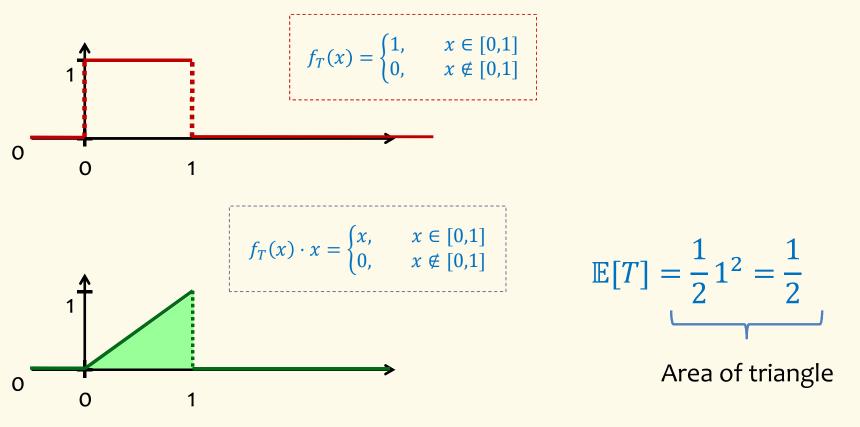

**Definition.** The **expected value** of a continuous RV *X* is defined as  $\mathbb{E}[X] = \int_{-\infty}^{+\infty} f_X(x) \cdot x \, \mathrm{d}x$ Proofs follow same **Fact.**  $\mathbb{E}[aX + bY + c] = a\mathbb{E}[X] + b\mathbb{E}[Y] + c$ ideas as discrete case **Definition.** The **variance** of a continuous RV *X* is defined as  $\operatorname{Var}(X) = \int_{-\infty}^{+\infty} f_X(x) \cdot (x - \mathbb{E}[X])^2 \, \mathrm{d}x = \mathbb{E}[X^2] - \mathbb{E}[X]^2$ 

# Agenda

- Uniform Distribution
- Exponential Distribution
- Normal Distribution

## **Expectation of a Continuous RV**

#### **Example.** *T* ~ Unif(0,1)

**Definition.** 

 $\mathbb{E}[X] = \int_{-\infty}^{+\infty} f_X(x) \cdot x \, \mathrm{d}x$ 

# **Uniform Density – Expectation**

 $X \sim \text{Unif}(a, b)$ 

$$f_X(x) = \begin{cases} \frac{1}{b-a} & x \in [a,b] \\ 0 & \text{else} \end{cases}$$

$$E[X] = \int_{-\infty}^{+\infty} f_X(x) \cdot x \, dx$$
  
=  $\frac{1}{b-a} \int_a^b x \, dx = \frac{1}{b-a} \left(\frac{x^2}{2}\right) \Big|_a^b = \frac{1}{b-a} \left(\frac{b^2 - a^2}{2}\right)$   
=  $\frac{(b-a)(a+b)}{2(b-a)} = \frac{a+b}{2}$ 

# **Uniform Density – Variance**

 $X \sim \text{Unif}(a, b)$ 

$$\mathbb{E}[X^2] = \int_{-\infty}^{+\infty} f_X(x) \cdot x^2 \, \mathrm{d}x$$

$$f_X(x) = \begin{cases} \frac{1}{b-a} & x \in [a,b] \\ 0 & \text{else} \end{cases}$$

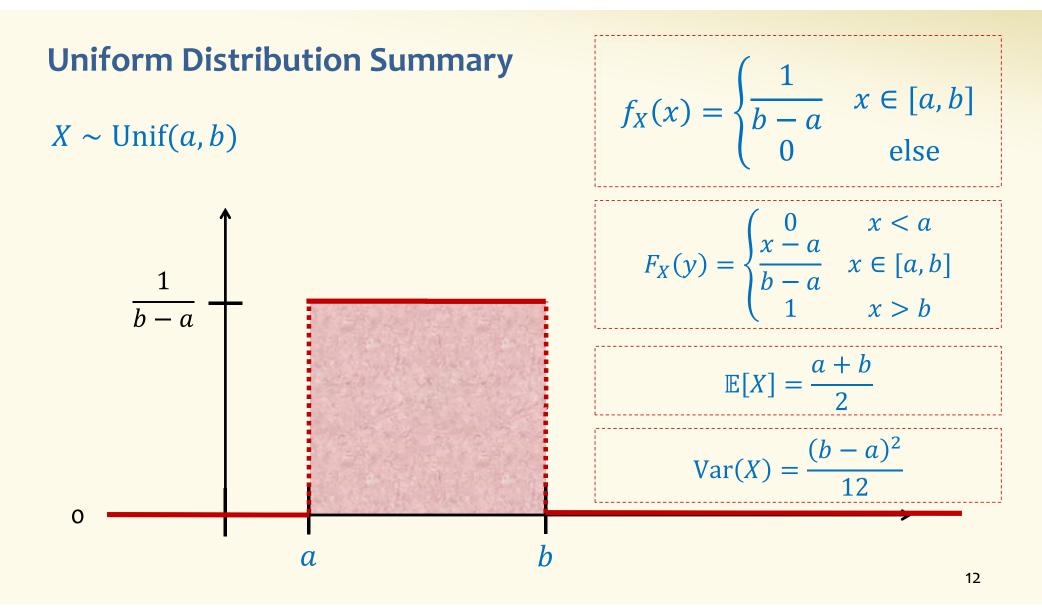

$$= \frac{1}{b-a} \int_{a}^{b} x^{2} dx = \frac{1}{b-a} \left(\frac{x^{3}}{3}\right) \Big|_{a}^{b} = \frac{b^{3}-a^{3}}{3(b-a)}$$
$$= \frac{(b-a)(b^{2}+ab+a^{2})}{3(b-a)} = \frac{b^{2}+ab+a^{2}}{3}$$

# **Uniform Density – Variance**

 $X \sim \text{Unif}(a, b)$ 

$$\mathbb{E}[X^2] = \frac{b^2 + ab + a^2}{3} \qquad \mathbb{E}[X] = \frac{a+b}{2}$$

$$Var(X) = \mathbb{E}[X^{2}] - \mathbb{E}[X]^{2}$$
$$= \frac{b^{2} + ab + a^{2}}{3} - \frac{a^{2} + 2ab + b^{2}}{4}$$
$$= \frac{4b^{2} + 4ab + 4a^{2}}{12} - \frac{3a^{2} + 6ab + 3b^{2}}{12}$$
$$= \frac{b^{2} - 2ab + a^{2}}{12} = \frac{(b - a)^{2}}{12}$$

# Agenda

- Uniform Distribution
- Exponential Distribution <
- Normal Distribution

# **Exponential Density**

#### Assume expected # of occurrences of an event per unit of time is $\lambda$ (independently)

- Cars going through intersection Rate of radioactive decay •
- Number of lightning strikes •
- Requests to web server ٠
- Patients admitted to ER ۲

#### Numbers of occurrences of event: Poisson distribution

$$P(X = i) = e^{-\lambda} \frac{\lambda^i}{i!}$$
 (Discrete)

How long to wait until next event? Exponential density!

Let's define it and then derive it!

# **Exponential Density - Warmup**

 $X \sim Poi(\lambda) \Rightarrow P(X = i) = e^{-\lambda} \frac{\lambda^i}{i!}$ 

#### Assume expected # of occurrences of an event per unit of time is $\lambda$ (independently)

What is the distribution of Z = # occurrences of event per t units of time?

 $\mathbb{E}[Z] = t\lambda$ 

Z is independent over disjoint intervals

so  $Z \sim Poi(t\lambda)$ 

# $X \sim Poi(\lambda) \Rightarrow P(X = i) = e^{-\lambda} \frac{\lambda^i}{i!}$

# **The Exponential PDF/CDF**

Assume expected # of occurrences of an event per unit of time is  $\lambda$  (independently) Numbers of occurrences of event: Poisson distribution How long to wait until next event? Exponential density!

- The exponential RV has range  $[0, \infty]$ , unlike Poisson with range  $\{0, 1, 2, ...\}$
- Let  $Y \sim Exp(\lambda)$  be the time till the first event. We will compute  $F_Y(t)$  and  $f_Y(t)$
- Let  $Z \sim Poi(t\lambda)$  be the # of events in the first t units of time, for  $t \ge 0$ .
- $P(Y > t) = P(\text{no event in the first } t \text{ units}) = P(Z = 0) = e^{-t\lambda} \frac{(t\lambda)^0}{0!} = e^{-t\lambda}$
- $F_Y(t) = P(Y \le t) = 1 P(Y > t) = 1 e^{-t\lambda}$
- $f_Y(t) = \frac{d}{dt}F_Y(t) = \lambda e^{-t\lambda}$

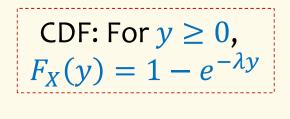

$$P(X > t) = e^{-t\lambda}$$

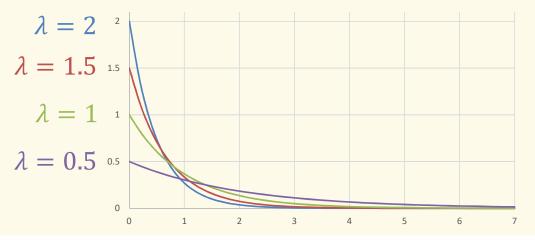

### **Exponential Distribution**

**Definition.** An **exponential random variable** *X* with parameter  $\lambda \ge 0$  is follows the exponential density

$$f_X(x) = \begin{cases} \lambda e^{-\lambda x} & x \ge 0\\ 0 & x < 0 \end{cases}$$

We write  $X \sim \text{Exp}(\lambda)$  and say X that follows the exponential distribution.

## **Expectation**

$$\mathbb{E}[X] = \int_{-\infty}^{+\infty} f_X(x) \cdot x \, dx$$
$$= \int_{0}^{+\infty} \lambda e^{-\lambda x} \cdot x \, dx$$
$$= \left( -(x + \frac{1}{\lambda})e^{-\lambda x} \right) \Big|_{0}^{\infty} = \frac{1}{\lambda}$$

 $f_X(x) = \begin{cases} \lambda e^{-\lambda x} & x \ge 0\\ 0 & x < 0 \end{cases}$  $P(X > t) = e^{-t\lambda}$ 

 $\mathbb{E}[X] = \frac{1}{\lambda}$ 

$$Var(X) = \frac{1}{\lambda^2}$$

Somewhat complex calculation use integral by parts

### Memorylessness

**Definition.** A random variable is **memoryless** if for all s, t > 0, P(X > s + t | X > s) = P(X > t).

**Fact.**  $X \sim \text{Exp}(\lambda)$  is memoryless.

Assuming an exponential distribution, if you've waited s minutes, The probability of waiting t more is exactly same as when s = 0.

## **Memorylessness of Exponential**

**Fact.**  $X \sim \text{Exp}(\lambda)$  is memoryless.

 $P(X > t) = e^{-\lambda t}$ 

Proof that assuming exp distr, if you've waited s minutes, prob of waiting t more is exactly same as when s = 0

**Proof.** 

$$P(X > s + t \mid X > s) = \frac{P(\{X > s + t\} \cap \{X > s\})}{P(X > s)}$$
$$= \frac{P(X > s + t)}{P(X > s)}$$
$$= \frac{e^{-\lambda(s+t)}}{e^{-\lambda s}} = e^{-\lambda t} = P(X > t)$$

The only memoryless RVs are the geometric RV (discrete) and Exp RV (continuous)

## Example

- Time it takes to check someone out at a grocery store is exponential with an expected value of 10 mins.
- Independent for different customers
- If you are the second person in line, what is the probability that you will have to wait between 10 and 20 mins?

$$T \sim Exp(\frac{1}{10})$$

$$P(10 \le T \le 20) = \int_{10}^{20} \frac{1}{10} e^{-\frac{x}{10}} dx$$

$$y = \frac{x}{10} \text{ so } dy = \frac{dx}{10}$$

$$P(10 \le T \le 20) = \int_{1}^{2} e^{-y} dy = -e^{-y} \Big|_{1}^{2} = e^{-1} - e^{-2}$$

# Example

- Time it takes to check someone out at a grocery store is exponential with an expected value of 10 mins.
- Independent for different customers
- If you are the second person in line, what is the probability that you will have to wait between 10 and 20 mins?

$$T \sim Exp(\frac{1}{10})$$
  
so  $F_T(t) = 1 - e^{-\frac{t}{10}}$   
 $P(10 \le T \le 20) = F_T(20) - F_T(10)$   
 $= 1 - e^{-\frac{20}{10}} - (1 - e^{-\frac{10}{10}}) = e^{-1} - e^{-2}$ 

# Agenda

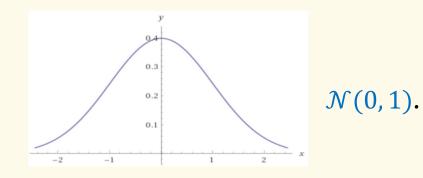

- Uniform Distribution
- Exponential Distribution
- Normal Distribution

# **The Normal Distribution**

**Definition.** A Gaussian (or normal) random variable with parameters  $\mu \in \mathbb{R}$  and  $\sigma \ge 0$  has density

$$f_X(x) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

We say that X follows the Normal Distribution, and write  $X \sim \mathcal{N}(\mu, \sigma^2)$ .

Carl Friedrich Gauss

# **The Normal Distribution**

Definition. A Gaussian (or normal) random variable with parameters  $\mu \in \mathbb{R}$  and  $\sigma \geq 0$  has density

$$f_X(x) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

**Carl Friedrich** 

Gauss

We say that X follows the Normal Distribution, and write  $X \sim \mathcal{N}(\mu, \sigma^2)$ .

**Fact.** If 
$$X \sim \mathcal{N}(\mu, \sigma^2)$$
, then  $\mathbb{E}[X] = \mu$ , and  $Var(X) = \sigma^2$ 

Proof of expectation is easy because density curve is symmetric around  $\mu$ ,  $f_X(\mu - x) = f_X(\mu + x)$ , but proof for variance requires integration of  $e^{-x^2/2}$ We will see next time why the normal distribution is (in some sense) the most important distribution.

## **The Normal Distribution**

#### Aka a "Bell Curve" (imprecise name)
