

CSE 312

Foundations of Computing II

Lecture 14: Continuous RV

Announcements

- PSet 4 due today
- PSet 3 returned yesterday
- Midterm general info is posted on Ed
 - In your section. Closed book . No electronic aids.
- Practice midterm is posted
 - Has format you will see, including 2-page “cheat sheet”.
 - Other practice materials linked also
- Midterm Q&A session next Tuesday 4pm on Zoom

Agenda

- Continuous Random Variables 
- Probability Density Function
- Cumulative Distribution Function

Often we want to model experiments where the outcome is not discrete.

Example – Lightning Strike

Lightning strikes a pole within a one-minute time frame

- T = time of lightning strike
- Every time within $[0,1]$ is equally likely
 - Time measured with infinitesimal precision.

The outcome space is not discrete

Lightning strikes a pole within a one-minute time frame

- T = time of lightning strike
- Every point in time within $[0,1]$ is equally likely

Lightning strikes a pole within a one-minute time frame

- T = time of lightning strike
- Every point in time within $[0,1]$ is equally likely

$$P(0.2 \leq T \leq 0.5) = 0.5 - 0.2 = 0.3$$

Lightning strikes a pole within a one-minute time frame

- T = time of lightning strike
- Every point in time within $[0,1]$ is equally likely

$$P(T = 0.5) = 0$$

Bottom line

- This gives rise to a different type of random variable
- $P(T = x) = 0$ for all $x \in [0,1]$
- Yet, somehow we want
 - $P(T \in [0,1]) = 1$
 - $P(T \in [a, b]) = b - a$
 - ...
- How do we model the behavior of T ?

First try: A discrete approximation

Recall: Cumulative Distribution Function (CDF)

A Discrete Approximation

Probability Mass Function
PMF

Cumulative Distribution Function
CDF

Definition. A **continuous random variable** X is defined by a **probability density function** (PDF) $f_X: \mathbb{R} \rightarrow \mathbb{R}$, such that

Non-negativity: $f_X(x) \geq 0$ for all $x \in \mathbb{R}$

Probability Density Function - Intuition

Non-negativity: $f_X(x) \geq 0$ for all $x \in \mathbb{R}$

Normalization: $\int_{-\infty}^{+\infty} f_X(x) dx = 1$

Probability Density Function - Intuition

Non-negativity: $f_X(x) \geq 0$ for all $x \in \mathbb{R}$

Normalization: $\int_{-\infty}^{+\infty} f_X(x) dx = 1$

$$P(a \leq X \leq b) = \int_a^b f_X(x) dx$$

Probability Density Function - Intuition

Non-negativity: $f_X(x) \geq 0$ for all $x \in \mathbb{R}$

Normalization: $\int_{-\infty}^{+\infty} f_X(x) dx = 1$

$$P(a \leq X \leq b) = \int_a^b f_X(x) dx$$

$$P(X = y) = P(y \leq X \leq y) = \int_y^y f_X(x) dx = 0$$

Density \neq Probability

$$f_X(y) \neq 0 \quad P(X = y) = 0$$

Probability Density Function - Intuition

Non-negativity: $f_X(x) \geq 0$ for all $x \in \mathbb{R}$

Normalization: $\int_{-\infty}^{+\infty} f_X(x) dx = 1$

$$P(a \leq X \leq b) = \int_a^b f_X(x) dx$$

$$P(X = y) = P(y \leq X \leq y) = \int_y^y f_X(x) dx = 0$$

$$P(X \approx y) \approx P\left(y - \frac{\epsilon}{2} \leq X \leq y + \frac{\epsilon}{2}\right) = \int_{y - \frac{\epsilon}{2}}^{y + \frac{\epsilon}{2}} \underline{f_X(x)} dx \approx \epsilon f_X(y)$$

What $f_X(x)$ measures: The local **rate** at which probability accumulates height $\frac{f(y)}{\epsilon}$

Probability Density Function - Intuition

Non-negativity: $f_X(x) \geq 0$ for all $x \in \mathbb{R}$

Normalization: $\int_{-\infty}^{+\infty} f_X(x) dx = 1$

$$P(a \leq X \leq b) = \int_a^b f_X(x) dx$$

$$P(X = y) = P(y \leq X \leq y) = \int_y^y f_X(x) dx = 0$$

$$P(X \approx y) \approx P\left(y - \frac{\epsilon}{2} \leq X \leq y + \frac{\epsilon}{2}\right) = \int_{y - \frac{\epsilon}{2}}^{y + \frac{\epsilon}{2}} f_X(x) dx \approx \epsilon f_X(y)$$

$$\frac{P(X \approx y)}{P(X \approx z)} \approx \frac{\epsilon f_X(y)}{\epsilon f_X(z)} = \frac{f_X(y)}{f_X(z)}$$

Definition. A **continuous random variable** X is defined by a **probability density function** (PDF) $f_X: \mathbb{R} \rightarrow \mathbb{R}$, such that

Non-negativity: $f_X(x) \geq 0$ for all $x \in \mathbb{R}$

Normalization: $\int_{-\infty}^{+\infty} f_X(x) dx = 1$

$$P(a \leq X \leq b) = \int_a^b f_X(x) dx$$

$$P(X = y) = P(y \leq X \leq y) = \int_y^y f_X(x) dx = 0$$

$$P(X \approx y) \approx P\left(y - \frac{\epsilon}{2} \leq X \leq y + \frac{\epsilon}{2}\right) = \int_{y-\frac{\epsilon}{2}}^{y+\frac{\epsilon}{2}} f_X(x) dx \approx \epsilon f_X(y)$$

$$\frac{P(X \approx y)}{P(X \approx z)} \approx \frac{\epsilon f_X(y)}{\epsilon f_X(z)} = \frac{f_X(y)}{f_X(z)}$$

PDF of Uniform RV

$$X \sim \text{Unif}(0,1)$$

Non-negativity: $f_X(x) \geq 0$ for all $x \in \mathbb{R}$ ✓

Normalization: $\int_{-\infty}^{+\infty} f_X(x) dx = 1$ ✓

$$f_X(x) = \begin{cases} 1, & x \in [0,1] \\ 0, & x \notin [0,1] \end{cases}$$

$$\int_{-\infty}^{+\infty} f_X(x) dx = \int_0^1 f_X(x) dx = 1 \cdot 1 = 1$$

Probability of Event

$X \sim \text{Unif}(0,1)$

$$f_X(x) = \begin{cases} 1, & x \in [0,1] \\ 0, & x \notin [0,1] \end{cases}$$

$$a < 0 \quad \int_a^b f_X(x) dx = \int_a^0 f_X(x) dx + \int_0^b f_X(x) dx$$

Non-negativity: $f_X(x) \geq 0$ for all $x \in \mathbb{R}$

Normalization: $\int_{-\infty}^{+\infty} f_X(x) dx = 1$

$$P(a \leq X \leq b) = \int_a^b f_X(x) dx$$

1. If $0 \leq a$ and $a \leq b \leq 1$

$$P(a \leq X \leq b) = b - a$$

2. If $a < 0$ and $0 \leq b \leq 1$

$$P(a \leq X \leq b) = b$$

3. If $a \geq 0$ and $b > 1$

$$P(a \leq X \leq b) = b - a$$

4. If $a < 0$ and $b > 1$

$$P(a \leq X \leq b) = 1$$

$$\int_a^b 1 dx = b - a$$

Poll: pollev/paulbeameo28

A. All of them are correct

B. Only 1, 2, 4 are right

C. Only 1 is right

D. Only 1 and 2 are right

maybe > 1

Probability of Event

$X \sim \text{Unif}(0,1)$

Non-negativity: $f_X(x) \geq 0$ for all $x \in \mathbb{R}$ ✓

Normalization: $\int_{-\infty}^{+\infty} f_X(x) dx = 1$ ✓

$$P(a \leq X \leq b) = \int_a^b f_X(x) dx \quad \checkmark$$

$$P(X = y) = P(y \leq X \leq y) = \int_y^y f_X(x) dx = 0 \quad \checkmark$$

$$P(X \approx y) \approx \epsilon f_X(y) = \epsilon$$

$$\frac{P(X \approx y)}{P(X \approx z)} \approx \frac{\epsilon f_X(y)}{\epsilon f_X(z)} = \frac{f_X(y)}{f_X(z)} \quad \checkmark$$

$$f_X(x) = \begin{cases} 1, & x \in [0,1] \\ 0, & x \notin [0,1] \end{cases}$$

PDF of Uniform RV

$$X \sim \text{Unif}(0,0.5)$$

Density \neq Probability

$f_X(x) \gg 1$ is possible!

$$f_X(x) = \begin{cases} 2, & x \in [0,0.5] \\ 0, & x \notin [0,0.5] \end{cases}$$

Uniform Distribution

$X \sim \text{Unif}(a, b)$

$$f_X(x) = \begin{cases} \frac{1}{b-a} & x \in [a, b] \\ 0 & \text{else} \end{cases}$$

$$\int_{-\infty}^{+\infty} f_X(x) dx = (b-a) \frac{1}{b-a} = 1$$

Example. $T \sim \text{Unif}(0,1)$

Probability Density Function

$$f_T(x) = \begin{cases} 1, & x \in [0,1] \\ 0, & x \notin [0,1] \end{cases}$$

Cumulative Distribution Function

$$F_T(x) = P(T \leq x) = \begin{cases} 0 & x \leq 0 \\ ? \times 0 & 0 \leq x \leq 1 \\ 1 & 1 \leq x \end{cases}$$

Cumulative Distribution Function

Definition. The **cumulative distribution function (cdf)** of X is

$$F_X(a) = P(X \leq a) = \int_{-\infty}^a f_X(x) dx$$

By the fundamental theorem of Calculus $f_X(x) = \frac{d}{dx} F_X(x)$

Therefore: $P(X \in [a, b]) = F(b) - F(a)$

F_X is monotone increasing, since $f_X(x) \geq 0$. That is $F_X(c) \leq F_X(d)$ for $c \leq d$

$$\lim_{a \rightarrow -\infty} F_X(a) = P(X \leq -\infty) = 0 \quad \lim_{a \rightarrow +\infty} F_X(a) = P(X \leq +\infty) = 1$$

From Discrete to Continuous

	Discrete	Continuous
PMF/PDF	$p_X(x) = P(X = x)$	$f_X(x) \neq P(X = x) = 0$
CDF	$F_X(x) = \sum_{t \leq x} p_X(t)$	$F_X(x) = \int_{-\infty}^x f_X(t) dt$
Normalization	$\sum_x p_X(x) = 1$	$\int_{-\infty}^{\infty} f_X(x) dx = 1$
Expectation	$\mathbb{E}[g(X)] = \sum_x g(x) p_X(x)$	$\mathbb{E}[g(X)] = \int_{-\infty}^{\infty} g(x) f_X(x) dx$

Expectation of a Continuous RV

Definition. The **expected value** of a continuous RV X is defined as

$$\mathbb{E}[X] = \int_{-\infty}^{+\infty} f_X(x) \cdot x \, dx$$

Fact. $\mathbb{E}[aX + bY + c] = a\mathbb{E}[X] + b\mathbb{E}[Y] + c$

Definition. The **variance** of a continuous RV X is defined as

$$\text{Var}(X) = \int_{-\infty}^{+\infty} f_X(x) \cdot (x - \mathbb{E}[X])^2 \, dx = \mathbb{E}[X^2] - \mathbb{E}[X]^2$$

Expectation of a Continuous RV

Example. $T \sim \text{Unif}(0,1)$

$$f_T(x) = \begin{cases} 1, & x \in [0,1] \\ 0, & x \notin [0,1] \end{cases}$$

$$f_T(x) \cdot x = \begin{cases} x, & x \in [0,1] \\ 0, & x \notin [0,1] \end{cases}$$

Definition.

$$\mathbb{E}[X] = \int_{-\infty}^{+\infty} f_X(x) \cdot x \, dx$$

$$\mathbb{E}[T] = \underbrace{\frac{1}{2} 1^2}_{\text{Area of triangle}} = \frac{1}{2}$$

Area of triangle

Uniform Distribution

$$X \sim \text{Unif}(a, b)$$

We also say that X follows the uniform distribution / is uniformly distributed

$$f_X(x) = \begin{cases} \frac{1}{b-a} & x \in [a, b] \\ 0 & \text{else} \end{cases}$$

Uniform Density – Expectation

$X \sim \text{Unif}(a, b)$

$$f_X(x) = \begin{cases} \frac{1}{b-a} & x \in [a, b] \\ 0 & \text{else} \end{cases}$$

$$\mathbb{E}[X] = \int_{-\infty}^{+\infty} f_X(x) \cdot x \, dx$$

$$\begin{aligned} &= \frac{1}{b-a} \int_a^b x \, dx = \frac{1}{b-a} \left(\frac{x^2}{2} \right) \Big|_a^b = \frac{1}{b-a} \left(\frac{b^2 - a^2}{2} \right) \\ &= \frac{(b-a)(a+b)}{2(b-a)} = \frac{a+b}{2} \end{aligned}$$

Uniform Density – Variance

$$X \sim \text{Unif}(a, b)$$

$$f_X(x) = \begin{cases} \frac{1}{b-a} & x \in [a, b] \\ 0 & \text{else} \end{cases}$$

$$\mathbb{E}[X^2] = \int_{-\infty}^{+\infty} f_X(x) \cdot x^2 \, dx$$

$$= \frac{1}{b-a} \int_a^b x^2 \, dx = \frac{1}{b-a} \left(\frac{x^3}{3} \right) \Big|_a^b = \frac{b^3 - a^3}{3(b-a)}$$

$$= \frac{(b-a)(b^2 + ab + a^2)}{3(b-a)} = \frac{b^2 + ab + a^2}{3}$$

Uniform Density – Variance

$$\mathbb{E}[X^2] = \frac{b^2 + ab + a^2}{3} \quad \mathbb{E}[X] = \frac{a + b}{2}$$

$$X \sim \text{Unif}(a, b)$$

$$\text{Var}(X) = \mathbb{E}[X^2] - \mathbb{E}[X]^2$$

$$= \frac{b^2 + ab + a^2}{3} - \frac{a^2 + 2ab + b^2}{4}$$

$$= \frac{4b^2 + 4ab + 4a^2}{12} - \frac{3a^2 + 6ab + 3b^2}{12}$$

$$= \frac{b^2 - 2ab + a^2}{12} = \frac{(b - a)^2}{12}$$
