CSE 312: Foundations of Computing II
Instructor: Alex Tsun
Date: 1/21/22
Lecture Topics: 3.5 Zoo of Discrete RVs II, 3.6 Zoo of Discrete RVs III

[**Tags:** PSet2 Q1, Zoo of Discrete RVs]

1. Match the following to the most appropriate distribution (from the Zoo of Discrete RVs), including parameters (e.g., your answer should be in the form like NegBin(30, 0.2), or Poi(100) for example). Distributions may be used more than once or not at all. Suppose there are B blue fish, R red fish, G green fish in a pond, where B + R + G = N. You do not need to show work for this problem.
    a. How many of the next 10 fish I catch are green, if I catch and release.
    b. How many fish I had to catch until my first blue fish, if I catch and release.
    c. How many red fish I catch in the next five minutes, if I catch on average r red fish per minute, if I catch and release.
    d. Whether or not my next fish is blue, if I catch and release.
    e. How many fish I had to catch until my fourth red fish, if I catch and release.
    f. How many blue fish I caught in one scoop of a net containing M fish.

2. Suppose Sammy the Beginner Tennis Player must practice his one-handed backhand in tennis. His goal is to hit them like Roger Federer does, so he does 1000 practice swings every day.
    a. Sammy misses the ball every time he swings with probability 0.8, independently of other swings. If he does manage to hit the ball with his swing, the probability it actually goes over the net is 0.1. What is the probability that when a ball comes, he hits it over the net?
    b. A day is a "huge success" if he hits it over the net at least fifty times that day. What is the probability of a huge success?
    c. Let p be your answer from part (b), the probability a single day is a huge success. Let X be the number of days he takes up to and including his first huge success. What is the PMF of X, $p_X(k)$?
    d. Let Y be the number of days up to and including his ninth huge success. What is the PMF of Y, $p_Y(k)$?
    e. What is $E[Y]$? (Hint: $E[X] = \frac{1}{p}$ from part (c). Try using linearity of expectation!)

3. Suppose you are working at Amazon, and you are unfortunately on-call for your team the entire year (that means, you are the person that they may ping in the middle of the night to debug issues). There are 5 SWE's on your team (including yourself), and each person independently introduces on average 0.1 bugs per work-week (Mon-Fri).
    a. What is the probability of having a bug-free work-week?
    b. What is the probability of having a bug-free day? What's the relationship between your answer to this part and the previous part?
    c. What is the probability that in a (52-week) year, that there are at least 40 bug-free weeks?
    d. Suppose it's the first Monday of the year. When would you expect the first day where you had to debug (at least) one issue (in number of work-days from today)?

e. Suppose it's the first Monday of the year. What is the probability that your tenth day of debugging happens in February or later (> 20 work-days from now)?

4. Suppose we have a hash function $h: \mathcal{U} \to \{0,1, \dots, m-1\}$ which maps from a universe $\mathcal{U}$ of strings (with length < 100) into m buckets, with each string independently and equally likely to be hashed into any bucket. We want to insert n strings $s_1, \dots, s_n$ into our hash table.
   a. Let $X_1 = h(s_1)$ be the index of the bucket that string s_1 hashes into. What distribution does X_1 have from our zoo?
   b. What is the probability that two particular strings s_1 and s_2 hash to the same bucket?
   c. If Y_1 is the number of strings in the first bucket after inserting all n strings, what distribution does Y_1 have from our zoo? What is the probability that the first bucket is empty?
   d. What is the expected number of empty buckets?
