

## Problem Set 1

Due: Wednesday, January 11, by 11:59pm

### Instructions

---

**Solutions format.** Every step in your solution should be explained carefully. The logical reasoning behind your solution should be sound and evident from your write-up.

For example, if you are asked to compute the number of ways to permute the set  $\{1, 2, 3, 4\}$  that start with 1 or 2, it is not enough to provide the answer 12. A complete approach would explain that (1) we can count separately the permutations starting with 1 and those starting with 2, and that (2) the two sets are disjoint, and hence the overall number is the sum of the numbers of permutations of each type. Then, (3) explain that there are  $3!$  permutations of each type. Finally, (4) say that the overall number totals to  $2 \cdot 3! = 12$ .

A higher number of mathematical symbols in your solution will not make your solution more precise or “better” – what *is* important is that the logical flow is complete and can be followed by the graders. Relying exclusively on mathematical symbols in fact often make the solution less readable. Avoid expressions such as “it easy to see” and “clearly” – just explain these steps.

Also, you may find the following [short note](#) (by Francis E. Su at Harvey Mudd) helpful.

Unless a problem states otherwise, you can leave your answer in terms of factorials, combinations, etc., for instance  $26^7$  or  $26!/7!$  or  $26 \cdot \binom{26}{7}$  are all good forms for final answers.

**Collaboration policy.** You are required to submit your own solutions for this problem set. You are allowed to discuss the homework with other students. However, the write up must clearly be your own, and moreover, you must be able to explain your solution at any time. We reserve ourselves the right to ask you to explain your work at any time in the course of this class.

**Late policy.** You have a total of **six** late days during the quarter, but can only use up to two late days on any one problem set. Please plan ahead, as we will not be willing to add any additional late days except in absolute, verifiable emergencies. The final problem set will not be accepted late (however, it will be due only on Friday of the last week of class).

**Solutions submission.** You must submit your solution via Gradescope. In particular:

- Submit a *single* PDF file containing the solution to all **written** tasks in the homework on Gradescope to “**PSet 1 [Written]**”. Each numbered task should be solved on its own page (or pages). Follow the prompt on Gradescope to link tasks to your pages. Submit your coding assignment on Gradescope to “**Pset 1 [Coding]**”.
- Do not write your name on the individual pages – Gradescope will handle that.
- We encourage you to typeset your solution. The homepage provides links to resources to help you doing so using  $\LaTeX$ . We have also provided a template file to start from. If you do use another tool (e.g., Microsoft Word), we request that you use a proper equation editor to display math (MS Word has one). For example, you should be able to write  $\sum_{i=1}^n x^i$  instead of  $x^{\wedge}1 +$

$x^2 + \dots + x^n$ . You can also provide a handwritten solution, as long as it is on a single PDF file that satisfies the above submission format requirements. It is your responsibility to make sure handwritten solutions are readable – we will *not* grade unreadable write-ups.

### Task 1 – Softball

[10 pts]

Thirteen people (5 children and 8 adults) on a softball team show up for a game.

1. (3 points) How many ways are there to choose 4 players to take the field?
2. (3 points) How many ways are there to assign 4 players to the positions of catcher, pitcher, 1st baseman and shortstop by selecting players from the 13 people who show up?
3. (4 points) How many ways are there to choose 4 players to take the field if at least one of these players must be an adult?

### Task 2 – Counting words

[24 pts]

We want to count the number of strings of length 6 from the English alphabet  $\{A, B, \dots, Z\}$  subject to a number of different constraints. Note that we consider the English alphabet here to consist of 6 *vowels* ( $\{A, E, I, O, U, Y\}$ ) and 20 *consonants*.

How many strings are there which ...

- a) (4 points) ... are only made of vowels?
- b) (4 points) ... are only made of consonants?
- c) (4 points) ... have *exactly* one vowel?
- d) (4 points) ... have *exactly* two vowels?
- e) (4 points) ... have at most two vowels, which may only appear in the second and fourth position?
- f) (4 points) ... have at least one vowel?

In all cases, explain your reasoning exactly – do not just give numbers or unjustified calculations.

### Task 3 – Arrangements

[12 pts]

How many different ways are there to arrange the letters in the following words?

1. (6 points) **MISSISSAUGA**
2. (6 points) **statistics**

#### Task 4 – Five card hands

[10 pts]

How many ways are there to select 6 cards from a standard deck of 52 cards if we require that all 4 suits are represented? Order doesn't matter.

#### Task 5 – From here to there

[20 pts]

In this problems you will consider paths on the integer grid that start at (0,0) in which every step increments one coordinate by 1 and leaves the other unchanged.

- a) (4 points) How many such paths are there from (0,0) to (85, 65)?
- b) (4 points) How many such paths are there from (0,0) to (85, 65) that go through (10,35)? How many such paths if they must go through (15,40) instead?
- c) (6 points) How many such paths are there from (0,0) to (85, 65) that go through (10,35), but do *not* go through (15,40).
- d) (6 points) How many such paths from (0,0) to (85, 65) are there that go through neither of (10,35) nor (15,40)?

#### Task 6 – Binomial Theorem applications

[15 pts]

- a) (7 points) What is the coefficient of  $x^4y^{12}$  in the expansion of  $(x - 3y^3)^8$ ?
- b) (8 points) Use the binomial theorem to prove that

$$\sum_{i=0}^{300} \binom{300}{300-i} (-6)^{300-i} = 5^{300}$$

#### Task 7 – A gentle introduction to Python

[15 pts]

1. **[Coding]** (10 points) Read the [Pset1 Coding](#) lesson on Edstem and follow the directions to complete 5 coding exercises. Then submit all required files to PSet1 [Coding] on Gradescope. The score that appears on Gradescope for this part is final.
2. (5 points) Read the [Edstem lesson](#) on Python's numpy library, after completing the previous part. You do **not** need to complete any coding exercises or submit anything to Gradescope for this part. The exercise that is there is entirely OPTIONAL, and intended only for practice if you need it. Afterwards, write down what you felt was the most confusing numpy function and/or class to you and why. If nothing is confusing, explain which function and/or class is the most interesting to you. We will grade based on completion and effort rather than correctness, and it's recommended that your answer be no longer than 5 sentences.
