## Midterm info

- Midterm info is posted on edstem
- I will post solutions to the practice midterm tomorrow.
- I will do a review in class next Friday.

# Zoo of Random Variables

$X \sim \text{Unif}(a, b)$

$$P(X = k) = \frac{1}{b - a + 1}$$

$$E[X] = \frac{a + b}{2}$$

$$\text{Var}(X) = \frac{(b - a)(b - a + 2)}{12}$$

$X \sim \text{Ber}(p)$

$$P(X = 1) = p, P(X = 0) = 1 - p$$

$$E[X] = p$$

$$\text{Var}(X) = p(1 - p)$$

$X \sim \text{Bin}(n, p)$

$$P(X = k) = \binom{n}{k} p^k (1 - p)^{n - k}$$

$$E[X] = np$$

$$\text{Var}(X) = np(1 - p)$$

$X \sim \text{Geo}(p)$

$$P(X = k) = (1 - p)^{k - 1} p$$

$$E[X] = \frac{1}{p}$$

$$\text{Var}(X) = \frac{1 - p}{p^2}$$

$X \sim \text{NegBin}(r, p)$

$$P(X = k) = \binom{k - 1}{r - 1} p^r (1 - p)^{k - r}$$

$$E[X] = \frac{r}{p}$$

$$\text{Var}(X) = \frac{r(1 - p)}{p^2}$$

$X \sim \text{HypGeo}(N, K, n)$

$$P(X = k) = \frac{\binom{K}{k} \binom{N - K}{n - k}}{\binom{N}{n}}$$

$$E[X] = n \frac{K}{N}$$

$$\text{Var}(X) = n \frac{K(N - K)(N - n)}{N^2(N - 1)}$$

## Example

Sending a binary message of length 1024 bits over a network with probability 0.999 of correctly sending each bit in the message without corruption (independent of other bits).

Let  $X$  be the number of corrupted bits.

What kind of random variable is this and what is  $E[X]$ ?

Poll:

[Slido.com/4694375](https://www.slido.com/join/4694375)

- a. 1022.99
- b. 1.024
- c. 1.02298
- d. 1

## Example: Music Lessons

Your music teacher requires you to play a 1000 note song without mistake. You have been practicing, so you have a probability of 0.999 of getting each note correct (independent of the others). If you mess up a single note in the song, you must start over and play from the beginning. Let  $X$  be the number of times you have to play the song from the start. What kind of random variable is this and what is  $E[X]$ ?

## Preview: Poisson

Model: # events that occur in an hour

- Expect to see 3 events per hour (but will be random)
- The expected number of events in  $t$  hours, is  $3t$
- Occurrence of events on disjoint time intervals is independent

## Example – Modelling car arrivals at an intersection

$X$  = # of cars passing through a light in 1 hour

## Example – Model the process of cars passing through a light in 1 hour

$X$  = # cars passing through a light in 1 hour.       $\mathbb{E}[X] = 3$

Assume: Occurrence of events on disjoint time intervals is independent

Approximation idea: Divide hour into  $n$  intervals of length  $1/n$

## Example – Model the process of cars passing through a light in 1 hour

$X = \#$  cars passing through a light in 1 hour. Disjoint time intervals are independent.

Know:  $\mathbb{E}[X] = \lambda$  for some given  $\lambda > 0$

This gives us  $n$  independent intervals

Assume either zero or one car per interval

$p =$  probability car arrives in an interval

What should  $p$  be?

[Slido.com/4694375](https://www.slido.com/join/4694375)

A.  $3/n$

B.  $3n$

C. 3

D.  $3/60$

## Example – Model the process of cars passing through a light in 1 hour

$X$  = # cars passing through a light in 1 hour. Disjoint time intervals are independent.

Know:  $\mathbb{E}[X] = \lambda$  for some given  $\lambda > 0$

**Discrete version:**  $n$  intervals, each of length  $1/n$ .

In each interval, there is a car with probability  $p = \lambda/n$  (assume  $\leq 1$  car can pass by)

**Each interval is Bernoulli:**  $X_i = 1$  if car in  $i^{\text{th}}$  interval (0 otherwise).  $P(X_i = 1) = \lambda/n$

$$X = \sum_{i=1}^n X_i \quad X \sim \text{Bin}(n, p) \quad P(X = i) = \binom{n}{i} \left(\frac{\lambda}{n}\right)^i \left(1 - \frac{\lambda}{n}\right)^{n-i}$$

indeed!  $\mathbb{E}[X] = pn = \lambda$

## Don't like discretization

$$X \text{ is binomial } P(X = i) = \binom{n}{i} \left(\frac{\lambda}{n}\right)^i \left(1 - \frac{\lambda}{n}\right)^{n-i}$$

We want now  $n \rightarrow \infty$

## Don't like discretization

$$X \text{ is binomial } P(X = i) = \binom{n}{i} \left(\frac{\lambda}{n}\right)^i \left(1 - \frac{\lambda}{n}\right)^{n-i}$$

We want now  $n \rightarrow \infty$

$$P(X = i) = \binom{n}{i} \left(\frac{\lambda}{n}\right)^i \left(1 - \frac{\lambda}{n}\right)^{n-i} = \underbrace{\frac{n!}{(n-i)! n^i}}_{\rightarrow 1} \frac{\lambda^i}{i!} \underbrace{\left(1 - \frac{\lambda}{n}\right)^n}_{\rightarrow e^{-\lambda}} \underbrace{\left(1 - \frac{\lambda}{n}\right)^{-i}}_{\rightarrow 1}$$
$$\rightarrow P(X = i) = e^{-\lambda} \cdot \frac{\lambda^i}{i!}$$

## Poisson Distribution

- Suppose “events” happen, independently, at an *average* rate of  $\lambda$  per unit time.
- Let  $X$  be the *actual* number of events happening in a given time unit. Then  $X$  is a *Poisson* r.v. with parameter  $\lambda$  (denoted  $X \sim \text{Poi}(\lambda)$ ) and has distribution (PMF):

$$P(X = i) = e^{-\lambda} \cdot \frac{\lambda^i}{i!}$$

Several examples of “Poisson processes”:

- # of cars passing through a traffic light in 1 hour
- # of requests to web servers in an hour
- # of photons hitting a light detector in a given interval
- # of patients arriving to ER within an hour

Assume  
fixed average rate

# Probability Mass Function

$$P(X = i) = e^{-\lambda} \cdot \frac{\lambda^i}{i!}$$

This Photo by Unknown Author is licensed under [CC BY-NC](#)

## Validity of Distribution

$$P(X = i) = e^{-\lambda} \cdot \frac{\lambda^i}{i!} \quad i = 0, 1, 2, \dots$$

Is this a valid probability mass function?

## Validity of Distribution

$$P(X = i) = e^{-\lambda} \cdot \frac{\lambda^i}{i!}$$

We first want to verify that Poisson probabilities sum up to 1.

$$\sum_{i=0}^{\infty} P(X = i) = \sum_{i=0}^{\infty} e^{-\lambda} \cdot \frac{\lambda^i}{i!} = e^{-\lambda} \underbrace{\sum_{i=0}^{\infty} \frac{\lambda^i}{i!}}$$

**Fact (Taylor series expansion):**

$$e^x = \sum_{i=0}^{\infty} \frac{x^i}{i!}$$

## Validity of Distribution

$$P(X = i) = e^{-\lambda} \cdot \frac{\lambda^i}{i!}$$

We first want to verify that Poisson probabilities sum up to 1.

$$\sum_{i=0}^{\infty} P(X = i) = \sum_{i=0}^{\infty} e^{-\lambda} \cdot \frac{\lambda^i}{i!} = e^{-\lambda} \underbrace{\sum_{i=0}^{\infty} \frac{\lambda^i}{i!}}_{e^{\lambda}} = e^{-\lambda} e^{\lambda} = 1$$

**Fact (Taylor series expansion):**

$$e^x = \sum_{i=0}^{\infty} \frac{x^i}{i!}$$

## Expectation

$$P(X = i) = e^{-\lambda} \cdot \frac{\lambda^i}{i!}$$

**Theorem.** If  $X$  is a Poisson RV with parameter  $\lambda \geq 0$ , then  
 $\mathbb{E}[X] = ?$

**Proof.** 
$$\mathbb{E}[X] = \sum_{i=0}^{\infty} P(X = i) \cdot i =$$

## Expectation

$$P(X = i) = e^{-\lambda} \cdot \frac{\lambda^i}{i!}$$

**Theorem.** If  $X$  is a Poisson RV with parameter  $\lambda$ , then  
$$\mathbb{E}[X] = \lambda$$

**Proof.**

$$\begin{aligned}\mathbb{E}[X] &= \sum_{i=0}^{\infty} P(X = i) \cdot i = \sum_{i=0}^{\infty} e^{-\lambda} \cdot \frac{\lambda^i}{i!} \cdot i = \sum_{i=1}^{\infty} e^{-\lambda} \cdot \frac{\lambda^i}{(i-1)!} \\ &= \lambda \sum_{i=1}^{\infty} e^{-\lambda} \cdot \frac{\lambda^{i-1}}{(i-1)!} \\ &= \lambda \sum_{i=0}^{\infty} e^{-\lambda} \cdot \frac{\lambda^i}{i!} = \lambda \cdot 1 = \lambda\end{aligned}$$

$= 1$  (see prior slides!)

## Variance

$$P(X = i) = e^{-\lambda} \cdot \frac{\lambda^i}{i!}$$

**Theorem.** If  $X$  is a Poisson RV with parameter  $\lambda$ , then  $\text{Var}(X) = \lambda$

**Proof.** 
$$\begin{aligned} \mathbb{E}[X^2] &= \sum_{i=0}^{\infty} P(X = i) \cdot i^2 = \sum_{i=0}^{\infty} e^{-\lambda} \cdot \frac{\lambda^i}{i!} \cdot i^2 = \sum_{i=1}^{\infty} e^{-\lambda} \cdot \frac{\lambda^i}{(i-1)!} \cdot i \\ &= \lambda \sum_{i=1}^{\infty} e^{-\lambda} \cdot \frac{\lambda^{i-1}}{(i-1)!} \cdot i = \lambda \sum_{j=0}^{\infty} e^{-\lambda} \cdot \frac{\lambda^j}{j!} \cdot (j+1) \\ &= \lambda \left[ \underbrace{\sum_{j=0}^{\infty} e^{-\lambda} \cdot \frac{\lambda^j}{j!} \cdot j}_{= \mathbb{E}[X] = \lambda} + \underbrace{\sum_{j=0}^{\infty} e^{-\lambda} \cdot \frac{\lambda^j}{j!}}_{= 1} \right] = \lambda^2 + \lambda \end{aligned}$$

Similar to the previous proof  
Verify offline.

$$\text{Var}(X) = \mathbb{E}[X^2] - \mathbb{E}[X]^2 = \lambda^2 + \lambda - \lambda^2 = \lambda$$

# Agenda

- Zoo of Discrete RVs

- Uniform Random Variables, Part I
- Bernoulli Random Variables, Part I
- Binomial Random Variables, Part I

- Poisson Distribution

- Approximate Binomial distribution using Poisson distribution

- Applications

- Negative Binomial Random Variables
- Hypergeometric Random Variables

## Poisson Random Variables

**Definition.** A **Poisson random variable**  $X$  with parameter  $\lambda \geq 0$  is such that for all  $i = 0, 1, 2, 3 \dots$ ,

$$P(X = i) = e^{-\lambda} \cdot \frac{\lambda^i}{i!}$$

Poisson approximates binomial when:

$n$  is very large,  $p$  is very small, and  $\lambda = np$  is “moderate”

e.g. ( $n > 20$  and  $p < 0.05$ ), ( $n > 100$  and  $p < 0.1$ )

Formally, Binomial approaches Poisson in the limit as  $n \rightarrow \infty$  (equivalently,  $p \rightarrow 0$ ) while holding  $np = \lambda$

# Probability Mass Function – Convergence of Binomials

$$\lambda = 5$$
$$p = \frac{5}{n}$$
$$n = 10, 15, 20$$

as  $n \rightarrow \infty$ ,  $\text{Binomial}(n, p = \lambda/n) \rightarrow \text{poi}(\lambda)$

## From Binomial to Poisson

$$X \sim \text{Bin}(n, p)$$

$$P(X = k) = \binom{n}{k} p^k (1 - p)^{n-k}$$

$$E[X] = np$$

$$\text{Var}(X) = np(1 - p)$$

$$\begin{aligned} n &\rightarrow \infty \\ np &= \lambda \\ p &= \frac{\lambda}{n} \rightarrow 0 \end{aligned}$$

$$X \sim \text{Poi}(\lambda)$$

$$P(X = k) = e^{-\lambda} \cdot \frac{\lambda^k}{k!}$$

$$E[X] = \lambda$$

$$\text{Var}(X) = \lambda$$

## Example -- Approximate Binomial Using Poisson

Consider sending bit string over a network

- Send bit string of length  $n = 10^4$
- Probability of (independent) bit corruption is  $p = 10^{-6}$

What is probability that message arrives uncorrupted?

Using  $X \sim \text{Poi}(\lambda = np = 10^4 \cdot 10^{-6} = 0.01)$

$$P(X = 0) = e^{-\lambda} \cdot \frac{\lambda^0}{0!} = e^{-0.01} \cdot \frac{0.01^0}{0!} \approx 0.990049834$$

Using  $Y \sim \text{Bin}(10^4, 10^{-6})$

$$P(Y = 0) \approx 0.990049829$$

## Sum of Independent Poisson RVs

Let  $X \sim \text{Poi}(\lambda_1)$  and  $Y \sim \text{Poi}(\lambda_2)$  such that  $\lambda = \lambda_1 + \lambda_2$ .

Let  $Z = X + Y$ . What kind of random variable is  $Z$ ?

Aka what is the “distribution” of  $Z$ ?

## Sum of Independent Poisson RVs

**Theorem.** Let  $X \sim \text{Poi}(\lambda_1)$  and  $Y \sim \text{Poi}(\lambda_2)$  such that  $\lambda = \lambda_1 + \lambda_2$ .

Let  $Z = X + Y$ . For all  $z = 0, 1, 2, 3, \dots$ ,

$$P(Z = z) = e^{-\lambda} \cdot \frac{\lambda^z}{z!}$$

More generally, let  $X_1 \sim \text{Poi}(\lambda_1), \dots, X_n \sim \text{Poi}(\lambda_n)$  such that  $\lambda = \sum_i \lambda_i$ .

Let  $Z = \sum_i X_i$

$$P(Z = z) = e^{-\lambda} \cdot \frac{\lambda^z}{z!}$$

## Sum of Independent Poisson RVs

**Theorem.** Let  $X \sim \text{Poi}(\lambda_1)$  and  $Y \sim \text{Poi}(\lambda_2)$  such that  $\lambda = \lambda_1 + \lambda_2$ .

Let  $Z = X + Y$ . For all  $z = 0, 1, 2, 3, \dots$ ,

$$P(Z = z) = e^{-\lambda} \cdot \frac{\lambda^z}{z!}$$

$P(Z = z) = ?$

1.  $P(Z = z) = \sum_{j=0}^z P(X = j, Y = z - j)$
2.  $P(Z = z) = \sum_{j=0}^{\infty} P(X = j, Y = z - j)$
3.  $P(Z = z) = \sum_{j=0}^z P(Y = z - j | X = j) P(X = j)$
4.  $P(Z = z) = \sum_{j=0}^z P(Y = z - j | X = j)$

[Slido.com/4694375](https://www.slido.com/join/4694375)

- A. All of them are right
- B. The first 3 are right
- C. Only 1 is right
- D. Don't know

**Theorem.** Let  $X \sim \text{Poi}(\lambda_1)$  and  $Y \sim \text{Poi}(\lambda_2)$  such that  $\lambda = \lambda_1 + \lambda_2$ .

Let  $Z = X + Y$ . For all  $z = 0, 1, 2, 3, \dots$ ,

$$P(Z = z) = e^{-\lambda} \cdot \frac{\lambda^z}{z!}$$

## Proof

$$P(Z = z) = \sum_{j=0}^z P(X = j, Y = z - j) \quad \text{Law of total probability}$$

## Proof

$$P(Z = z) = \sum_{j=0}^z P(X = j, Y = z - j)$$

Law of total probability

$$= \sum_{j=0}^z P(X = j) P(Y = z - j) = \sum_{j=0}^z e^{-\lambda_1} \cdot \frac{\lambda_1^j}{j!} \cdot e^{-\lambda_2} \cdot \frac{\lambda_2^{z-j}}{(z-j)!}$$

Independence

$$= e^{-\lambda_1 - \lambda_2} \left( \sum_{j=0}^z \frac{1}{j! (z-j)!} \cdot \lambda_1^j \lambda_2^{z-j} \right)$$

$$= e^{-\lambda} \left( \sum_{j=0}^z \frac{z!}{j! (z-j)!} \cdot \lambda_1^j \lambda_2^{z-j} \right) \frac{1}{z!}$$

$$= e^{-\lambda} \cdot (\lambda_1 + \lambda_2)^z \cdot \frac{1}{z!} = e^{-\lambda} \cdot \lambda^z \cdot \frac{1}{z!}$$

Binomial  
Theorem

## Poisson Random Variables

**Definition.** A **Poisson random variable**  $X$  with parameter  $\lambda \geq 0$  is such that for all  $i = 0, 1, 2, 3 \dots$ ,

$$P(X = i) = e^{-\lambda} \cdot \frac{\lambda^i}{i!}$$

### General principle:

- Events happen at an average rate of  $\lambda$  per time unit
- Number of events happening at a time unit  $X$  is distributed according to  $\text{Poi}(\lambda)$
- Poisson approximates Binomial when  $n$  is large,  $p$  is small, and  $np$  is moderate
- Sum of independent Poisson is still a Poisson

# Zoo of Random Variables

$X \sim \text{Poisson}(\lambda)$

$$P(X = i) = e^{-\lambda} \cdot \frac{\lambda^i}{i!}$$

$$E[X] = \lambda$$

$$\text{Var}(X) = \lambda$$

$X \sim \text{Ber}(p)$

$$P(X = 1) = p, P(X = 0) = 1 - p$$

$$E[X] = p$$

$$\text{Var}(X) = p(1 - p)$$

$X \sim \text{Bin}(n, p)$

$$P(X = k) = \binom{n}{k} p^k (1 - p)^{n-k}$$

$$E[X] = np$$

$$\text{Var}(X) = np(1 - p)$$

$X \sim \text{Geo}(p)$

$$P(X = k) = (1 - p)^{k-1} p$$

$$E[X] = \frac{1}{p}$$

$$\text{Var}(X) = \frac{1 - p}{p^2}$$

$X \sim \text{NegBin}(r, p)$

$$P(X = k) = \binom{k-1}{r-1} p^r (1 - p)^{k-r}$$

$$E[X] = \frac{r}{p}$$

$$\text{Var}(X) = \frac{r(1 - p)}{p^2}$$

$X \sim \text{HypGeo}(N, K, n)$

$$P(X = k) = \frac{\binom{K}{k} \binom{N-K}{n-k}}{\binom{N}{n}}$$

$$E[X] = n \frac{K}{N}$$

$$\text{Var}(X) = n \frac{K(N-K)(N-n)}{N^2(N-1)}$$

## Negative Binomial Random Variables

A discrete random variable  $X$  that models the number of independent trials  $Y_i \sim \text{Ber}(p)$  before seeing the  $r^{\text{th}}$  success.

Equivalently,  $X = \sum_{i=1}^r Z_i$  where  $Z_i \sim \text{Geo}(p)$ .

$X$  is called a **Negative Binomial random variable** with parameters  $r, p$ .

**Notation:**  $X \sim \text{NegBin}(r, p)$

**PMF:**  $P(X = k) =$

**Expectation:**  $\mathbb{E}[X] =$

## Negative Binomial Random Variables

A discrete random variable  $X$  that models the number of independent trials  $Y_i \sim \text{Ber}(p)$  before seeing the  $r^{\text{th}}$  success.

Equivalently,  $X = \sum_{i=1}^r Z_i$  where  $Z_i \sim \text{Geo}(p)$ .

$X$  is called a **Negative Binomial random variable** with parameters  $r, p$ .

**Notation:**  $X \sim \text{NegBin}(r, p)$

**PMF:**  $P(X = k) = \binom{k-1}{r-1} p^r (1-p)^{k-r}$

**Expectation:**  $\mathbb{E}[X] = \frac{r}{p}$

**Variance:**  $\text{Var}(X) = \frac{r(1-p)}{p^2}$

## Hypergeometric Random Variables

A discrete random variable  $X$  that models the number of successes in  $n$  draws (without replacement) from  $N$  items that contain  $K$  successes in total.  $X$  is called a **Hypergeometric RV** with parameters  $N, K, n$ .

**Notation:**  $X \sim \text{HypGeo}(N, K, n)$

**PMF:** 
$$P(X = k) = \frac{\binom{K}{k} \binom{N-K}{n-k}}{\binom{N}{n}}$$

**Expectation:** 
$$\mathbb{E}[X] = n \frac{K}{N}$$

**Variance:** 
$$\text{Var}(X) = n \frac{K(N-K)(N-n)}{N^2(N-1)}$$

Hope you enjoyed the zoo!

$X \sim \text{Unif}(a, b)$

$$P(X = k) = \frac{1}{b - a + 1}$$

$$\mathbb{E}[X] = \frac{a + b}{2}$$

$$\text{Var}(X) = \frac{(b - a)(b - a + 2)}{12}$$

$X \sim \text{Ber}(p)$

$$P(X = 1) = p, P(X = 0) = 1 - p$$

$$\mathbb{E}[X] = p$$

$$\text{Var}(X) = p(1 - p)$$

$X \sim \text{Bin}(n, p)$

$$P(X = k) = \binom{n}{k} p^k (1 - p)^{n - k}$$

$$\mathbb{E}[X] = np$$

$$\text{Var}(X) = np(1 - p)$$

$X \sim \text{Geo}(p)$

$$P(X = k) = (1 - p)^{k - 1} p$$

$$\mathbb{E}[X] = \frac{1}{p}$$

$$\text{Var}(X) = \frac{1 - p}{p^2}$$

$X \sim \text{NegBin}(r, p)$

$$P(X = k) = \binom{k - 1}{r - 1} p^r (1 - p)^{k - r}$$
