CSE 312 Foundations of Computing II

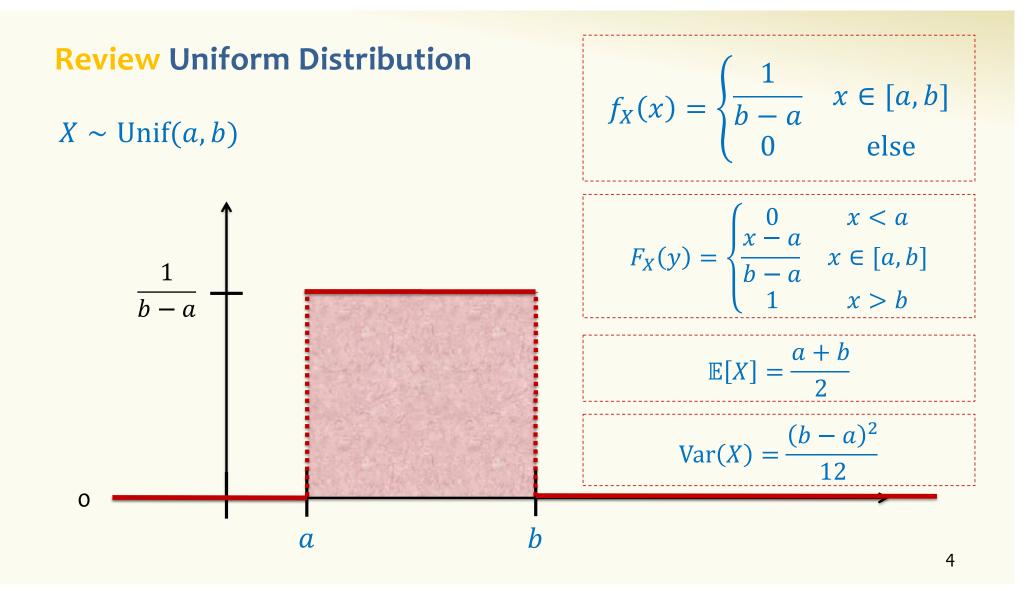

17: Normal Distribution & Central Limit Theorem

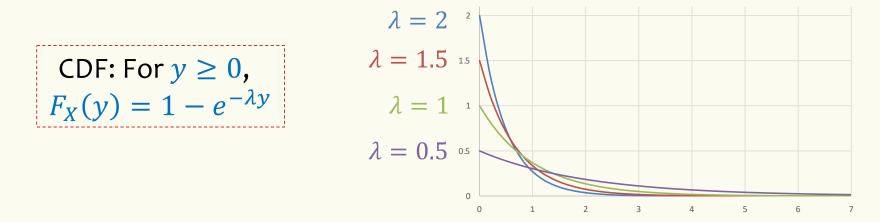

Review Exponential Distribution

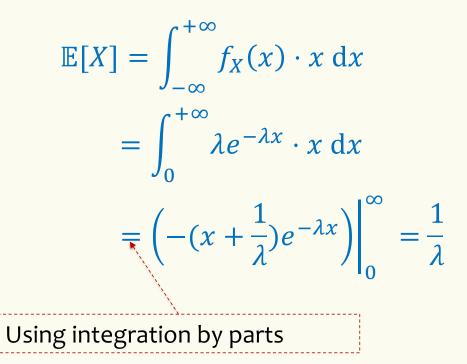

Definition. An **exponential random variable** *X* with parameter $\lambda \ge 0$ is follows the exponential density

$$f_X(x) = \begin{cases} \lambda e^{-\lambda x} & x \ge 0\\ 0 & x < 0 \end{cases}$$

We write $X \sim \text{Exp}(\lambda)$ and say X that follows the exponential distribution.

Expectation

$$f_X(x) = \begin{cases} \lambda e^{-\lambda x} & x \ge 0\\ 0 & x < 0 \end{cases}$$
$$P(X > t) = e^{-t\lambda}$$
$$\mathbb{E}[X] = \frac{1}{\lambda}$$
$$Var(X) = \frac{1}{\lambda^2}$$

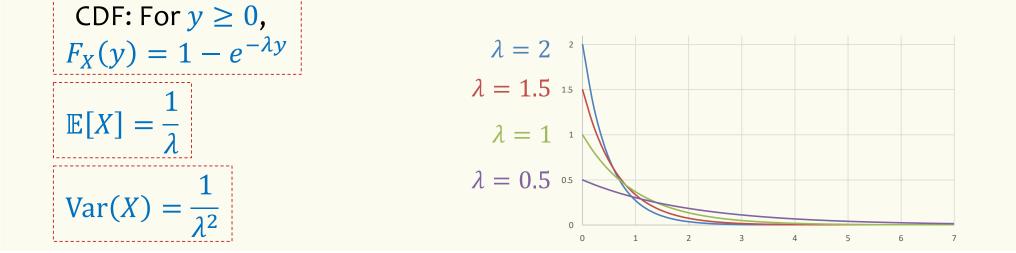

$P(X > t) = e^{-t\lambda}$

Exponential Distribution

We write $X \sim \text{Exp}(\lambda)$ and say X that follows the exponential distribution.

Definition. An **exponential random variable** *X* with parameter $\lambda \ge 0$ is follows the exponential density

$$f_X(x) = \begin{cases} \lambda e^{-\lambda x} & x \ge 0\\ 0 & x < 0 \end{cases}$$

Memorylessness

Definition. A random variable is **memoryless** if for all s, t > 0, P(X > s + t | X > s) = P(X > t).

Fact. $X \sim \text{Exp}(\lambda)$ is memoryless.

Assuming an exponential distribution, if you've waited s minutes, The probability of waiting t more is exactly same as when s = 0.

Agenda

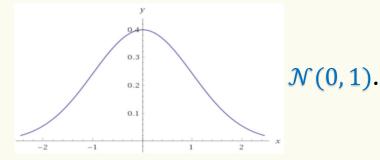

- Normal Distribution <

- Central Limit Theorem (CLT)

The Normal Distribution

Definition. A Gaussian (or normal) random variable with parameters $\mu \in \mathbb{R}$ and $\sigma^2 \ge 0$ has density

$$f_X(x) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

We say that X follows the Normal Distribution, and write $X \sim \mathcal{N}(\mu, \sigma^2)$.

No closed form expression for CDF...

Carl Friedrich Gauss

The Normal Distribution. $X \sim \mathcal{N}(\mu, \sigma^2)$

Definition. A Gaussian (or <u>normal</u>) random variable *X* with parameters $\mu \in \mathbb{R}$ and $\sigma \ge 0$ has density

$$f_X(x) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

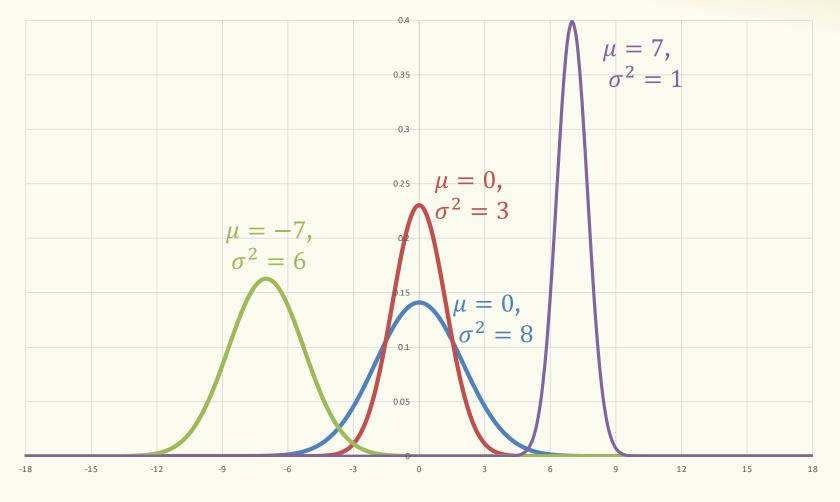

Carl Friedrich Gauss

Fact. If $X \sim \mathcal{N}(\mu, \sigma^2)$, then $\mathbb{E}[X] = \mu$, and $Var(X) = \sigma^2$

Proof of expectation is easy because density curve is symmetric around μ , $f_X(\mu - x) = f_X(\mu + x)$, but proof for variance requires integration of $e^{-x^2/2}$

The Normal Distribution

Aka a "Bell Curve" (imprecise name)

Standard normal distribution

Standard (unit) normal = $\mathcal{N}(0, 1)$

CDF.
$$\Phi(z) = P(Z \le z) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{z} e^{-x^2/2} dx$$
 for $Z \sim \mathcal{N}(0, 1)$

Note: $\Phi(z)$ has no closed form – generally given via tables

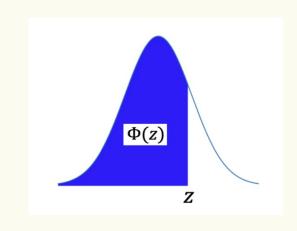

Table of Standard Cumulative Normal Density $\mathcal{N}(0, 1)$

 Φ Table: $\mathbb{P}(Z \leq z)$ when $Z \sim \mathcal{N}(0, 1)$

 $P(Z \le 0.98) = \Phi(0.98) \approx 0.8365$

 $P(Z \le 1) = \Phi(1.00) \approx 0.84134$

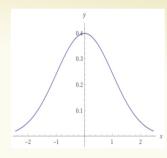

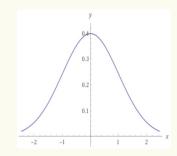

$P(Z \le 1) = \Phi(1.00) \approx 0.84$

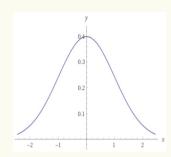

The Standard Normal CDF

What is the probability that a standard Normal is within one standard deviation of its mean?

 $P(-1 \le Z \le 1) =$

Important facts about normal distributions

Fact: Normal distributions stay normal under shifting and scaling. **Fact.** If $X \sim \mathcal{N}(\mu, \sigma^2)$, then $\frac{X-\mu}{\sigma} \sim \mathcal{N}(0, 1)$

Closure of normal distribution – Under Shifting and Scaling

Fact. If
$$X \sim \mathcal{N}(\mu, \sigma^2)$$
, then $\frac{X-\mu}{\sigma} \sim \mathcal{N}(0, 1)$

Fact. If $X \sim \mathcal{N}(\mu, \sigma^2)$, then $Y = aX + b \sim \mathcal{N}(a\mu + b, a^2\sigma^2)$

Mean and variance follow from properties you know! The fact that Y is still normal is not obvious, but not too difficult

Closure of normal distribution – Under Shifting and Scaling

If
$$X \sim \mathcal{N}(\mu, \sigma^2)$$
, then $\frac{X - \mu}{\sigma} \sim \mathcal{N}(0, 1)$

Therefore,

$$F_X(z) = P(X \le z) = P\left(\frac{X-\mu}{\sigma} \le \frac{z-\mu}{\sigma}\right) = \Phi\left(\frac{z-\mu}{\sigma}\right)$$

And can look up the value in the standard normal table.

Agenda

- Normal Distribution
- Practice with Normals
- Central Limit Theorem (CLT)

Example

Let $X \sim \mathcal{N}(0.4, 4 = 2^2)$.

$P(X \le 1.2) =$

 $\Phi(z)$

Example

Let
$$X \sim \mathcal{N}(3, 16)$$
.
 $P(2 < X < 5) = P\left(\frac{2-3}{4} < \frac{X-3}{4} < \frac{5-3}{4}\right)$
 $= P\left(-\frac{1}{4} < Z < \frac{1}{2}\right)$
 $= \Phi\left(\frac{1}{2}\right) - \Phi\left(-\frac{1}{4}\right)$
 $= \Phi\left(\frac{1}{2}\right) - \left(1 - \Phi\left(\frac{1}{4}\right)\right) \approx 0.29017$

Summary so far

- Normal distributions stay normal under shifting and scaling.
- To "standardize" a normal random variable $X \sim \mathcal{N}(\mu, \sigma^2)$, you subtract the mean and divide by the standard deviation, i.e., $\frac{X - \mu}{\sigma} \sim \mathcal{N}(0, 1)$
- This allows you to use the standard normal tables (showing $\Phi(z) = P(Z \le z)$ for $Z \sim \mathcal{N}(0, 1)$) to do calculations for any normal distribution.

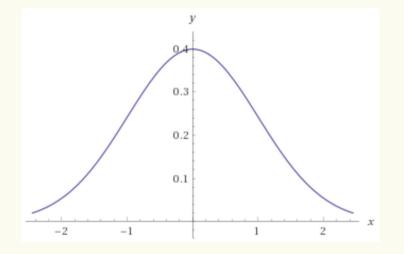

Another important property: closure under addition

Fact. If $X \sim \mathcal{N}(\mu_X, \sigma_X^2)$, $Y \sim \mathcal{N}(\mu_Y, \sigma_Y^2)$ (both independent normal RV) then $aX + bY + c \sim \mathcal{N}(a\mu_X + b\mu_Y + c, a^2\sigma_X^2 + b^2\sigma_Y^2)$

Note: The special thing is that **the sum of normal RVs is still a normal RV**. The values of the expectation and variance are **not** surprising.

Why not surprising?

- Linearity of expectation (always true)
- When X and Y are independent, $Var(aX + bY) = a^2Var(X) + b^2Var(Y)$

Normal Distributions EVERYWHERE – why?

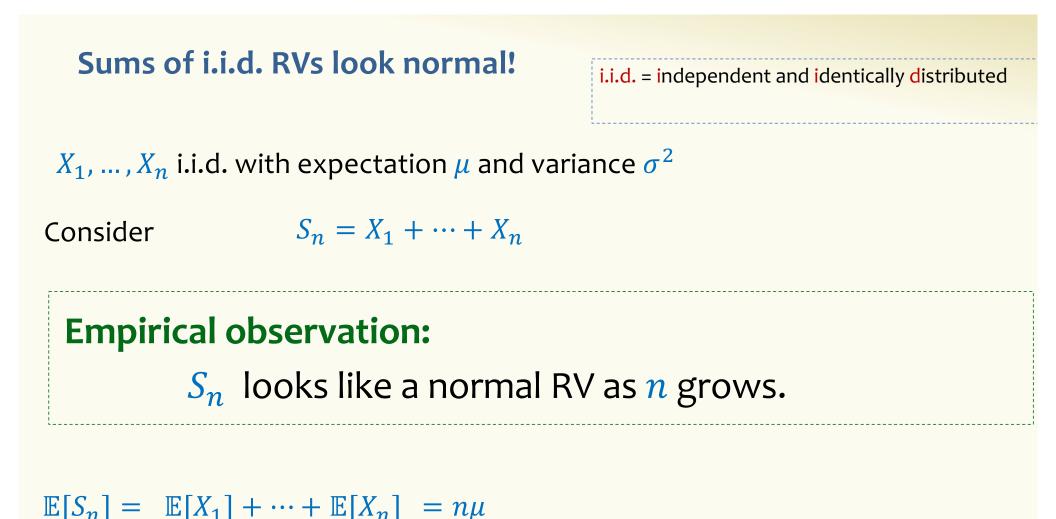

S&P 500 Returns after Elections

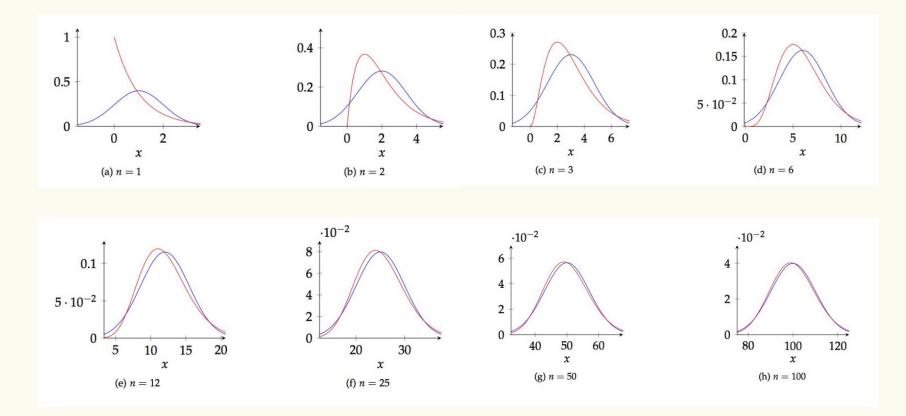

Examples from: https://galtonboard.com/probabilityexamplesinlife

 $Var(S_n) = Var(X_1) + \dots + Var(X_n) = n\sigma^2$

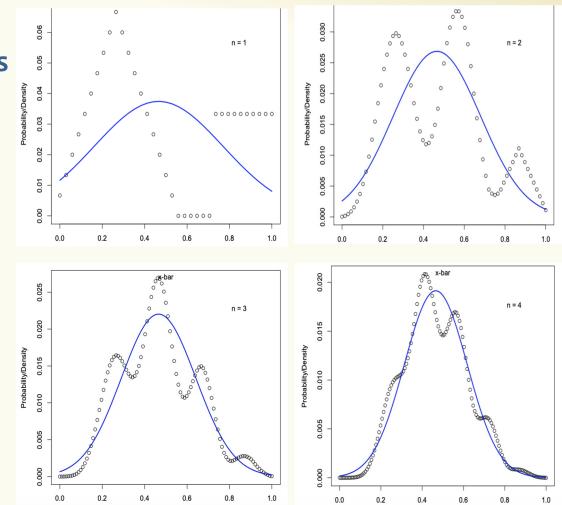

Example: Sum of n i.i.d. Exp(1) random variables

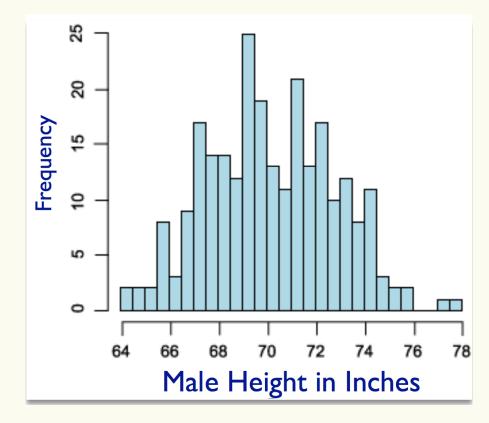

Example: avg of uniform r.v.s

CLT : Avg of some other weird i.i.d. r.v.s

Suppose that what we see in nature results from combining (summing) many independent random observations...

Then distribution might look normal. e.g. Height distribution resembles Gaussian.

R.A.Fisher (1918) observed that the height is likely the outcome of the sum of many independent random parameters, i.e., can written as

 $X = X_1 + \dots + X_n$

Sums of i.i.d. RVs

i.i.d. = independent and identically distributed

 X_1, \dots, X_n i.i.d. with expectation μ and variance σ^2

Define $S_n = X_1 + \dots + X_n$

 $\mathbb{E}[S_n] = \mathbb{E}[X_1] + \dots + \mathbb{E}[X_n] = n\mu$ $Var(S_n) = Var(X_1) + \dots + Var(X_n) = n\sigma^2$

 X_1, \ldots, X_n i.i.d., each with expectation μ and variance σ^2

Define
$$S_n = X_1 + \dots + X_n$$
 and
 $Y_n = \frac{S_n - n\mu}{\sigma\sqrt{n}}$

$$E[S_n] = E[X_1] + \dots + E[X_n] = n\mu$$

$$Var(S_n) = Var(X_1) + \dots + Var(X_n) = n\sigma^2$$

$$E[Y_n] = \frac{1}{\sigma\sqrt{n}} (E[S_n] - n\mu) = \frac{1}{\sigma\sqrt{n}} (n\mu - n\mu) = 0$$

$$Var(Y_n) = \frac{1}{\sigma^2 n} (Var(S_n - n\mu)) = \frac{Var(S_n)}{\sigma^2 n} = \frac{\sigma^2 n}{\sigma^2 n} = 1$$

 X_1, \dots, X_n i.i.d., each with expectation μ and variance σ^2

Define $S_n = X_1 + \dots + X_n$, $Y_n = \frac{S_n - n\mu}{\sigma\sqrt{n}}$

Then distribution of $Y_n = \frac{S_n - n\mu}{\sigma\sqrt{n}}$ converges to that of a normal distribution with mean 0 and variance 1 as $n \to \infty$.

$$Y_n = \frac{X_1 + \dots + X_n - n\mu}{\sigma\sqrt{n}}$$

Theorem. (Central Limit Theorem) The CDF of Y_n converges to the CDF of the standard normal $\mathcal{N}(0,1)$, i.e.,

$$\lim_{n \to \infty} P(Y_n \le y) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{y} e^{-x^2/2} \mathrm{d}x$$

$$Y_n = \frac{X_1 + \dots + X_n - n\mu}{\sigma\sqrt{n}}$$

Theorem. (Central Limit Theorem) The CDF of Y_n converges to the CDF of the standard normal $\mathcal{N}(0,1)$, i.e.,

$$\lim_{n \to \infty} P(Y_n \le y) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{y} e^{-x^2/2} dx$$

Also stated as:

- $\lim_{n\to\infty} Y_n \to \mathcal{N}(0,1)$
- $\lim_{n \to \infty} \frac{1}{n} \sum_{i=1}^{n} X_i \to \mathcal{N}\left(\mu, \frac{\sigma^2}{n}\right)$ for $\mu = \mathbb{E}[X_i]$ and $\sigma^2 = \operatorname{Var}(X_i)$

CLT application

- You buy lightbulbs that burn out according to an exponential distribution with parameter $\lambda = 1.8$ lightbulbs per year.
- You buy a pack of 10 (independent) light bulbs. What is the probability that your 10-pack lasts at least 5 years?

 $\Phi(z)$

Summary Central Limit Theorem

 X_1, \ldots, X_n i.i.d., each with expectation μ and variance σ^2

Define
$$S_n = X_1 + \dots + X_n$$
 and $\overline{X} = \frac{1}{n} \sum_{i=1}^n X_i$. and $Y_n = \frac{S_n - n\mu}{\sigma \sqrt{n}}$

mean

variance

CLT:

Outline of CLT steps – extra step if random variables are discrete.

- Write the event you are interested in, in terms of a sum of i.i.d. random variables.
- Normalize RV to have mean 0 and standard deviation 1.
- Write event in terms of Φ , the CDF of a $\mathcal{N}(0,1)$.
- Look up in table.

Outline of CLT steps – extra step if random variables are discrete.

- Write the event you are interested in, in terms of a sum of i.i.d. random variables.
- Apply continuity correction if RVs are discrete (see tomorrow's section and Tsun Section 5.7.4)
- Normalize RV to have mean 0 and standard deviation 1.
- Write event in terms of Φ , the CDF of a $\mathcal{N}(0,1)$.
- Look up in table.

Example – How Many Standard Deviations Away?

Let $X \sim \mathcal{N}(\mu, \sigma^2)$.

$$P(|X - \mu| < k\sigma) = P\left(\frac{|X - \mu|}{\sigma} < k\right) =$$
$$= P\left(-k < \frac{X - \mu}{\sigma} < k\right) = \Phi(k) - \Phi(-k)$$

e.g. k = 1: 68% k = 2: 95% k = 3: 99%
