

3. Fill in the blanks using **backward** reasoning.

```
{ {  $x + 3 * b - 4 > 0$  } }  
a = x + b;
```

```
{ {  $a + 2 * b - 4 > 0$  } }  
c = 2 * b - 4;
```

```
{ {  $a + c > 0.$  } }  
x = a + c;
```

```
{ { x > 0 } }
```

4. Fill in the blanks using **backward** reasoning.

```
{ {  $y > 15 \vee (y \leq 5 \wedge y + z > 17)$  } }  
if (y > 5) {
```

```
    { {  $y > 15$  } }  
    x = y + 2
```

```
    { {  $x > 17$  } }  
} else {
```

```
    { {  $y + z > 17$  } }  
    x = y + z;
```

```
    { {  $x > 17$  } }  
}  
{ { x > 17 } }
```

5. Fill in the blanks using **backward** reasoning (extra practice problems).

a.

```
{ {  $x - 1 \neq 0$  } }  
x = x - 2;
```

```
{ {  $x + 1 \neq 0$  } }  
z = x + 1;
```

```
{ { z \neq 0 } }
```

b.

```
{ { 3 * y > 0 } }  
x = 2 * y;  
  
{ { x + y > 0 } }  
z = x + y;  
  
{ { z > 0 } }
```

c.

```
{ { v + 1 < 0 V -2 * w < 0 } }  
w = 2 * w;  
  
{ { v + 1 < 0 V -w < 0 } }  
z = -w;  
  
{ { v + 1 < 0 V z < 0 } }  
y = v + 1;  
  
{ { y < 0 V z < 0 } }  
x = min(y, z);  
  
{ { x < 0 } }
```

6. Prove that the following code computes the minimum.

This can be done using either forward or backward reasoning. Or a combination!

Forward reasoning:

```
{ { true } }  
if (x < y) {  
  
    { { true /\ x < y } }  
    m = x;  
  
    { { x < y /\ m = x } }  
} else {  
  
    { { true /\ x >= y } }  
    m = y;  
  
    { { x >= y /\ m = y } }  
}  
{ { (x < y /\ m = x) \/ (x >= y /\ m = y) } }  
  
{ { m = min(x, y) } }
```

Backward reasoning:

```
{(x <= y /\ x < y) \/ (y <= x /\ x >= y)} => {true}
if (x < y) {

    {(x <= y) }
    m = x;

    {(m = min(x, y)) }
} else {

    {(y <= x) }
    m = y;

    {(m = min(x, y)) }
}
{(same) }
{(m = min(x, y)) }
```

7. For each pair of logical assertions, circle the **stronger** logical assertion (or indicate that the pair is **incomparable**).

- | | |
|--------------------|----------------------------------|
| a. {(y > 23)} | {(y >= 23)} |
| b. {(y = 23)} | {(y >= 23)} |
| c. {(y < 0.23)} | {(y < 0.00023)} (equally strong) |
| d. {(x = y * z)} | {(y = x / z)} (incomparable) |
| e. {(is_prime(y))} | {(is_odd(y))} (incomparable) |

7d is fairly non-trivial, requiring close examination of possible program states. Also, remember that variables are always integers, and a forward slash is always truncating integer division unless otherwise stated.

To see that the assertions in 7d are incomparable, consider the following program states: x is 5, z is 2, and y is 2; and x is 0, z is 0, and y is 0.
