OF COMPUTER SCIENCE & ENGINEERING

# CSE341: Programming Languages

## Lecture 1

### Course Mechanics

### ML Variable Bindings

Zach Tatlock

Winter 2018

# *Welcome!*

We have 10 weeks to learn *the fundamental concepts* of programming languages

With hard work, patience, and an open mind, this course makes you a much better programmer

- Even in languages we won't use
- Learn the core ideas around which *every* language is built, despite countless surface-level differences and variations
- *Poor* course summary: “Uses ML, Racket, and Ruby”

Today's class:

- Course mechanics
- *[A rain-check on motivation]*
- Dive into ML: Homework 1 due Friday of next week

# *Concise to-do list*

In the next 24-48 hours:

1. Read course web page:  
<http://courses.cs.washington.edu/courses/cse341/18wi/>
2. Read all course policies (4 short documents on web page)
3. Adjust class email-list settings as necessary
4. Get set up using Emacs [optional; recommended] and ML
  - Installation/configuration/use instructions on web page
  - Essential; non-intellectual
    - No reason to delay!

# *Who: Course Staff*

Zach Tatlock: Faculty, 341 my favorite course / area of expertise

Four (!! ) *great* TAs

*Get to know us!*

# *Who: Course Creator*

Dan Grossman, CSE Faculty

Occasionally will be referred  
to as “Prof. DJG”

Has poured blood, sweat, and  
tears into this material.

*Awesome material, any  
mistakes / shortcomings  
are Zach’s fault!*

# *Staying in touch*

- Course email list: `cse341a_wi18@u.washington.edu`
  - Students and staff already subscribed
  - You must get announcements sent there
  - Fairly low traffic
- Course staff: `cse341-staff@cs.washington.edu`  
plus individual emails
- Message Board
  - For appropriate discussions; TAs will monitor
  - Optional/encouraged, won't use for important announcements

# Lecture: Zach

- Slides, code, and reading notes / videos posted
  - May be revised after class
  - *Take notes*: materials may not describe everything
    - Slides in particular are *visual aids* for me to use
- Ask questions, focus on key ideas
- Engage actively
  - Arrive *punctually* (beginning matters most!) and well-rested
    - Just like you will for the midterm!
  - *Write* down ideas and code as we go
  - If attending and paying attention is a poor use of your time, one of us is doing something wrong

# *Section*

- Required: will usually cover new material
- Sometimes more language or environment details
- Sometimes main ideas needed for homework
- *Will* meet this week: using Emacs and ML

Material often also covered in reading notes / videos

# *Reading Notes and Videos*

- Posted for each “course unit”
  - Go over most (all?) of the material (and some extra stuff?)
- So why come to class?
  - Materials let us make class-time much more useful and interactive
    - Answer questions without being rushed because *occasionally* “didn’t get to X; read/watch about it”
    - Can point to optional topics/videos
    - Can try different things in class, not just recite things
- Don’t need other textbooks – Prof DJG has roughly made one

# Office hours

- Regular hours and locations on course web
  - Changes as necessary announced on email list
- Use them
  - *Please visit me*
  - Ideally not *just* for homework questions (but that's good too)

# *Homework*

- Seven total
- To be done individually
- Doing the homework involves:
  1. Understanding the concepts being addressed
  2. Writing code demonstrating understanding of the concepts
  3. Testing your code to ensure you understand and have correct programs
  4. “Playing around” with variations, incorrect answers, etc.Only (2) is graded, but focusing on (2) makes homework harder
- Challenge problems: Low points/difficulty ratio

# *Note 341 writing style*

- Homeworks tend to be worded very precisely and concisely
  - Written “as a computer scientist” (a good thing!)
  - Technical issues deserve precise technical writing
  - Conciseness values your time as a reader
  - You should try to be precise too
- *Skimming or not understanding why a word or phrase was chosen can make the homework harder*
- By all means ask if a problem is confusing
  - Being confused is normal and understandable
  - And I may have made a mistake

# *Academic Integrity*

- Read the course policy carefully
  - Clearly explains how you can and cannot get/provide help on homework and projects
- Always explain any unconventional action
- I have promoted and enforced academic integrity since I was a freshman
  - Great trust with little sympathy for violations
  - Honest work is the most important feature of a university
- This course especially: Do not web-search for homework solutions! We will check!

# *Exams*

- Midterm: Friday February 2, in class
- Final: Thursday March 15, 8:30-10:20am
- Same concepts, but different format from homework
  - More conceptual (but write code too)
  - Will post old exams
  - Closed book/notes, but you bring one sheet with whatever you want on it

# *Coursera (more info in document)*

- Prof. DJG has taught this material to thousands of people around the world
  - A lot of work and extremely rewarding
- You are not allowed to participate in that class!
  - Do not web-search related to homework problems!
- This should have little impact on you
  - Two courses are separate
  - 341 is a great class and staff is committed to this offering being the best ever

# *Has Coursera help/hurt 341?*

- Biggest risks
  - Becomes easier to cheat – don't! (And we've changed things)
  - Instructors become too resistant to change – hope not!
- There are benefits too
  - The videos
  - More robust grading scripts
  - Way fewer typos
  - Easier software installation (new SML Mode)
  - Taking the “VIP version” of a more well-known course
  - Change the world to be more 341-friendly

# *Questions?*

*Anything I forgot about course mechanics before we discuss, you know, programming languages?*

# *What this course is about*

- Many essential concepts relevant in any programming language
  - And how these pieces fit together
- Use ML, Racket, and Ruby languages:
  - They let many of the concepts “shine”
  - Using multiple languages shows how the same concept can “look different” or actually be slightly different
  - In many ways simpler than Java
- Big focus on *functional programming*
  - Not using *mutation* (assignment statements) (!)
  - Using *first-class functions* (can’t explain that yet)
  - But many other topics too

# *Why learn this?*

This is the “normal” place for course motivation

- Why learn this material?

But in our experience, we don't yet have enough shared vocabulary

- So 3-4 week delay on motivation for functional programming
- I promise full motivation: delay is worth it
- (Will motivate immutable data at end of “Unit 1”)

# 341 claim

*Learning to think about software in this “PL” way will make you a better programmer even if/when you go back to old ways*

*It will also give you the mental tools and experience you need for a lifetime of confidently picking up new languages and ideas*

[Somewhat in the style of *The Karate Kid* movies (1984, 2010)]

# *A strange environment*

- Next 4-5 weeks will use
  - ML language
  - Emacs editor
  - Read-eval-print-loop (REPL) for evaluating programs
- Need to get things installed and configured
  - Either in the department labs or your own machine
  - We've written thorough instructions (questions welcome)
- Only then can you focus on the content of Homework 1
- Working in strange environments is a CSE life skill

# *Mindset*

- “Let go” of all programming languages you already know
- For now, treat ML as a “totally new thing”
  - Time later to compare/contrast to what you know
  - For now, “oh that seems kind of like this thing in [Java]” will confuse you, slow you down, and you will learn less
- Start from a blank file...

# *A very simple ML program*

[ The same program we just wrote in Emacs;  
here for convenience if reviewing the slides ]

```
(* My first ML program *)  
  
val x = 34;  
  
val y = 17;  
  
val z = (x + y) + (y + 2);  
  
val q = z + 1;  
  
val abs_of_z = if z < 0 then 0 - z else z;  
  
val abs_of_z_simpler = abs z
```

# A variable binding

```
val z = (x + y) + (y + 2); (* comment *)
```

More generally:

```
val x = e;
```

- *Syntax*:
  - Keyword `val` and punctuation `=` and `;`
  - Variable `x`
  - Expression `e`
    - Many forms of these, most containing *subexpressions*

# *The semantics*

- **Syntax** is just how you write something
- **Semantics** is what that something means
  - **Type-checking** (before program runs)
  - **Evaluation** (as program runs)
- For variable bindings:
  - Type-check expression and extend **static environment**
  - Evaluate expression and extend **dynamic environment**

So what is the precise syntax, type-checking rules, and evaluation rules for various expressions? Good question!

# *ML, carefully, so far*

- A program is a sequence of *bindings*
- *Type-check* each binding in order using the *static environment* produced by the previous bindings
- *Evaluate* each binding in order using the *dynamic environment* produced by the previous bindings
  - Dynamic environment holds *values*, the results of evaluating expressions
- So far, the only kind of binding is a *variable binding*
  - More soon

# Expressions

- We have seen many kinds of expressions:

**34   true   false   x   e1+e2   e1<e2**  
**if e1 then e2 else e3**

- Can get arbitrarily large since any subexpression can contain subsubexpressions, etc.
- Every kind of expression has
  1. Syntax
  2. Type-checking rules
    - Produces a type or fails (with a bad error message ☹)
    - Types so far: **int   bool   unit**
  3. Evaluation rules (used only on things that type-check)
    - Produces a value (or exception or infinite-loop)

# *Variables*

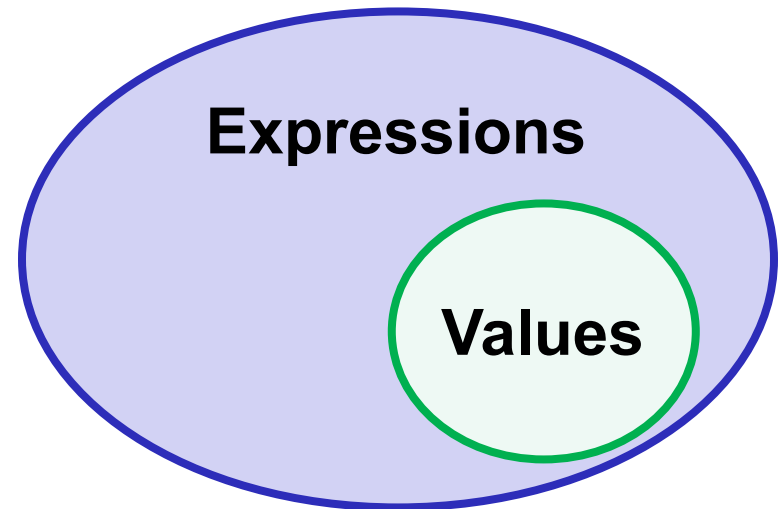

- Syntax:
  - sequence of letters, digits, `_`, not starting with digit
- Type-checking:
  - Look up type in current static environment
    - If not there fail
- Evaluation:
  - Look up value in current dynamic environment

# *Addition*

- Syntax:  
 $e1 + e2$  where  $e1$  and  $e2$  are expressions
- Type-checking:  
If  $e1$  and  $e2$  have type `int`,  
then  $e1 + e2$  has type `int`
- Evaluation:  
If  $e1$  evaluates to  $v1$  and  $e2$  evaluates to  $v2$ ,  
then  $e1 + e2$  evaluates to sum of  $v1$  and  $v2$

# Values

- All values are expressions
- Not all expressions are values
- A value “evaluates to itself” in “zero steps”
- Examples:
  - `34, 17, 42` have type `int`
  - `true, false` have type `bool`
  - `()` has type `unit`

# *Slightly tougher ones*

*What are the syntax, typing rules, and evaluation rules for conditional expressions?*

*What are the syntax, typing rules, and evaluation rules for less-than expressions?*

# *The foundation we need*

We have many more types, expression forms, and binding forms to learn before we can write “anything interesting”

Syntax, typing rules, evaluation rules will guide us the whole way!

For Homework 1: functions, pairs, conditionals, lists, options, and local bindings

- Earlier problems require less

Will not add (or need):

- Mutation (a.k.a. assignment): use new bindings instead
- Statements: everything is an expression
- Loops: use recursion instead
