CSE 373 - Data Structures - 21 - Topological Sort

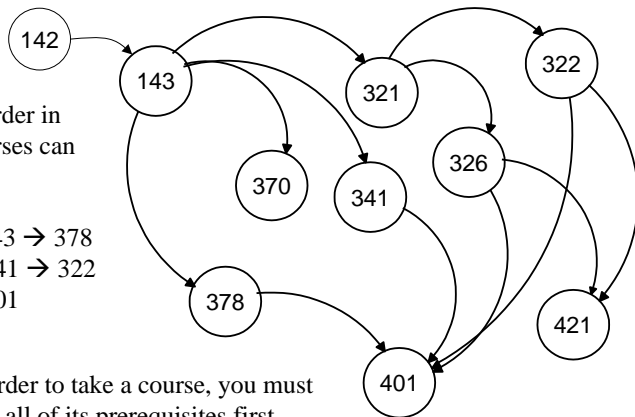

2

# Topological Sort

**Problem:** Find an order in which all these courses can be taken.

Example: 142 → 143 → 378  
→ 370 → 321 → 341 → 322  
→ 326 → 421 → 401

In order to take a course, you must take all of its prerequisites first

# Topological Sort

Given a digraph  $G = (V, E)$ , find a linear ordering of its vertices such that:

for any edge  $(v, w)$  in  $E$ ,  $v$  precedes  $w$  in the ordering

# Topo sort - good example

Note that F can go anywhere in this list because it is not connected.

# Topo sort - bad example

# Topo sort algorithm - 1

**Step 1:** Identify vertices that have no incoming edges

- The “in-degree” of these vertices is zero

# Topo sort algorithm - 1a

**Step 1:** Identify vertices that have no incoming edges

- If *no such vertices*, graph has cycle(s) (cyclic graph)
- Topological sort not possible – Halt.

# Topo sort algorithm - 1b

Step 1: Identify vertices that have no incoming edges

- Select one such vertex

# Topo sort algorithm - 2

Step 2: Delete this vertex of in-degree 0 and all its outgoing edges from the graph. Place it in the output.

# Cook until done

Repeat Step 1 and Step 2 until graph is empty

# B

Select B. Copy to sorted list. Delete B and its edges.

# C

Select C. Copy to sorted list. Delete C and its edges.

# D

Select D. Copy to sorted list. Delete D and its edges.

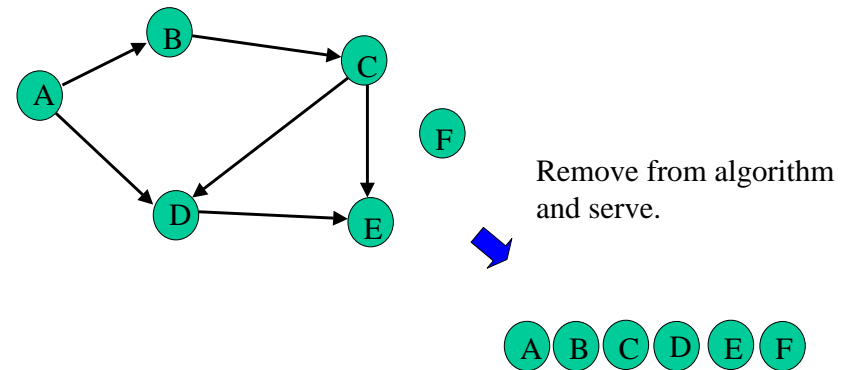

# E, F

Select E. Copy to sorted list. Delete E and its edges.  
Select F. Copy to sorted list. Delete F and its edges.

# Done

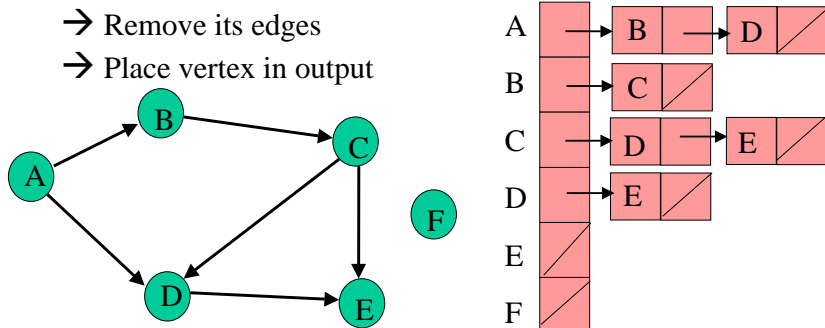

# Topo sort run time analysis

For input graph  $G = (V, E)$ , Run Time =  $O(?)$  Assume adjacency list representation

Break down into total time to:

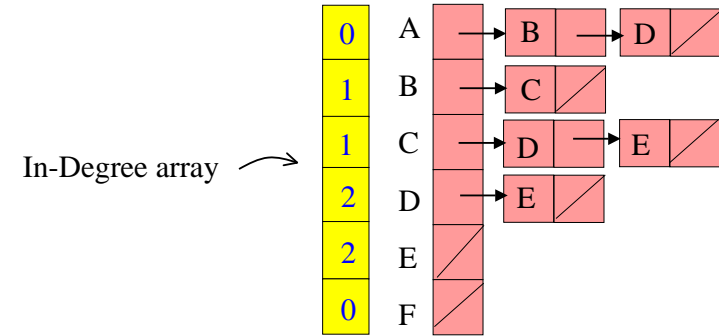

- Find a vertex with in-degree 0
- Remove its edges
- Place vertex in output

# Tracking “in-degree”

Calculate and store In-Degree of all vertices in an array

- Find vertex with in-degree 0: Search the array
- Remove its edges: Update the array

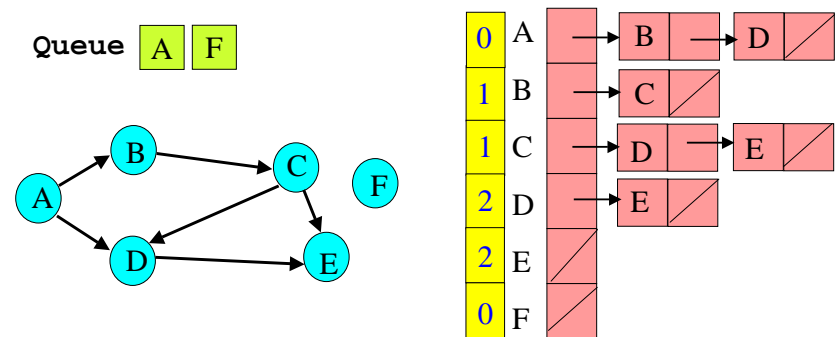

# Topo Sort<sub>1</sub> run time

- Find vertices with in-degree 0:
  - >  $|V|$  vertices, and for each vertex it takes  $O(|V|)$  to search the In-Degree array =  $O(|V|^2)$
- Remove edges:
  - >  $|E|$  edges
- Place vertices in output:
  - >  $|V|$  vertices
- For input graph  $G = (V, E)$ 
  - > Run Time =  $O(|V|^2 + |E|)$
  - > Quadratic in  $|V|$

We need a better way to find the next vertex with  $degree(v)=0$  ...

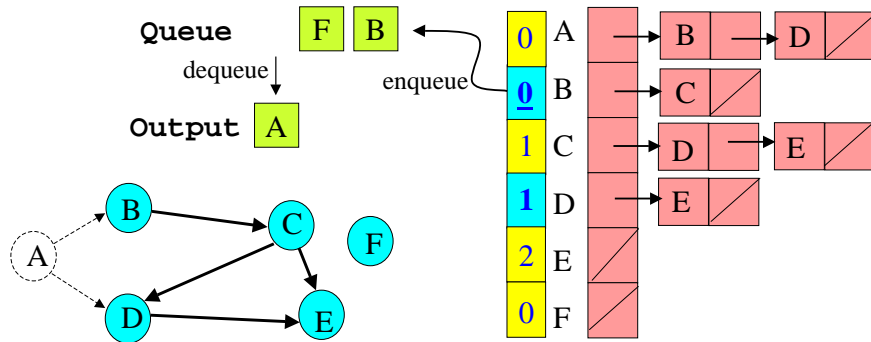

# Topo Sort with queue

Key idea: Initialize and maintain a queue (or stack) of vertices with In-Degree 0

## Topo Sort with queue

After each vertex is output, when updating In-Degree array, enqueue any vertex whose In-Degree has become zero

## Topological Sort Algorithm #2

- Store each vertex's In-Degree in an array
- Initialize queue with all "in-degree=0" vertices
- While there are vertices remaining in the queue:
  - > Dequeue and output a vertex
  - > Reduce In-Degree of all vertices adjacent to it by 1
  - > Enqueue any of these vertices whose In-Degree became zero

## Topo Sort<sub>2</sub> run time

- Initialize In-Degree array:  $O(|E|)$
- Initialize Queue with In-Degree 0 vertices:  $O(|V|)$
- Dequeue and output vertex:
  - >  $|V|$  vertices, each takes only  $O(1)$  to dequeue and output:  $O(|V|)$
- Reduce In-Degree of all vertices adjacent to a vertex and Enqueue any In-Degree 0 vertices:
  - >  $O(|E|)$
- For input graph  $G=(V,E)$  run time =  $O(|V| + |E|)$ 
  - > Linear in  $|V|$
