

More on Lists

CSE 373
Data Structures

Alternative Addition

- Use an auxiliary function
 - › AddAux(p,q : node pointer, cb : integer) which returns the result of adding p and q and the carry/borrow cb.
 - › Add(p,q) := AddAux(p,q,0)
 - › Advantage: more like what we learned in grade school (and more like actual binary adders in hardware).

CSE 373 SP 04- More on Lists

2

Auxiliary Addition

- Positive numbers (or negative numbers)

4/7/2004

CSE 373 SP 04- More on Lists

3

Auxiliary Addition

- Mixed numbers

4/7/2004

CSE 373 SP 04- More on Lists

4

Copy

- Design a recursive algorithm to make a copy of a linked list (like the one used for long integers)

```
Copy(p : node pointer) : node pointer {  
  ???  
}
```

5

Comparing Long Integers

```
IsZero(p : node pointer) : boolean { //p points to the sign node  
  return p.next = null;  
}  
IsPositive(p : node pointer) : boolean { //p points to the sign node  
  return not IsZero(p) and p.value = 1;  
}  
Negate(p : node pointer) : node pointer { //destructive  
  if p.value = 1 then p.value := -1  
  else p.value := 1;  
  return p;  
}  
LessThan(p,q : node pointer) : boolean { // non destructive  
  p1,q1 : node pointer;  
  p1 := Copy(p); q1 := Copy(q);  
  return IsPositive(Add(q1,Negate(p1))); // x < y iff 0 < y - x  
  //We assume Add and Negate are destructive  
}
```

6

List Mergesort

- Overall sorting plan

4/7/2004

CSE 373 SP 04- More on Lists

7

Mergesort pseudocode

```
Mergesort(p : node pointer) : node pointer {
  Case {
    p = null : return p; //no elements
    p.next = null : return p; //one element
    else
      d : duo pointer; // duo has two fields first,second
      d := Split(p);
      return Merge(Mergesort(d.first),Mergesort(d.second));
  }
}
```

Note: Mergesort is destructive.

4/7/2004

CSE 373 SP 04- More on Lists

8

Split

```
Split(p : node pointer) : duo pointer {
  d : duo pointer;
  Case {
    p = null : d := new duo; return d;//both fields are null
    p.next = null : d := new duo; d.first := p ; return d
    //d.second is null
    else :
      d := Split(p.next.next);
      p.next.next := d.first;
      d.first := p.next;
      p.next := d.second;
      d.second := p;
      return d;
  }
}
```

12

Merge

```

Merge(p,q : node pointer): node pointer{
case {
p = null : return q;
q = null : return p;
LessThan(p.value,q.value) :
p.next := Merge(p.next,q);
return p;
else :
q.next := Merge(p,q.next);
return q;
}
}
    
```

16

Implementing Pointers in Arrays — “Cursor Implementation”

- This is needed in languages like Fortran, Basic, and assembly language
- Easiest when number of records is known ahead of time.
- Each record field of a basic type is associated with an array.
- A pointer field is an unsigned integer indicating an array index.

4/7/2004

CSE 373 SP 04- More on Lists

17

Idea

Pointer World

n nodes
data next
data : basic type
next : node pointer

Nonpointer World

- D[] : basic type array
- N[] : integer array
- Pointer is an integer
- null is 0
- p.data is D[p]
- p.next is N[p]
- Free list needed for node allocation

19

Example of Use

4/7/2004

CSE 373 SP 04- More on Lists

20

Try DeleteFront

- Define the cursor implementation of DeleteFront which removes the first member of the list when there is one.
 - Remember to add garbage to free list.

```

DeleteFront(L : integer) {
  ???
}

```

21

Copy Solution

```

Copy(p : node pointer) : node pointer {
  if p = null then return null
  else {
    q : node pointer;
    q := new node; //by convention the value
                  //field is 0 and the
                  //pointer field is null
    q.value := p.value;
    q.next := Copy(p.next);
    return q;
  }
}

```

4/7/2004

CSE 373 SP 04- More on Lists

22

DeleteFront Solution

```

DeleteFront(L : integer) {
  q : integer;
  if L = 0 then return "underflow"
  else {
    q := L;
    L := N[L];
    N[q] := Free;
    Free := q;
  }
}

```
