Lecture 17

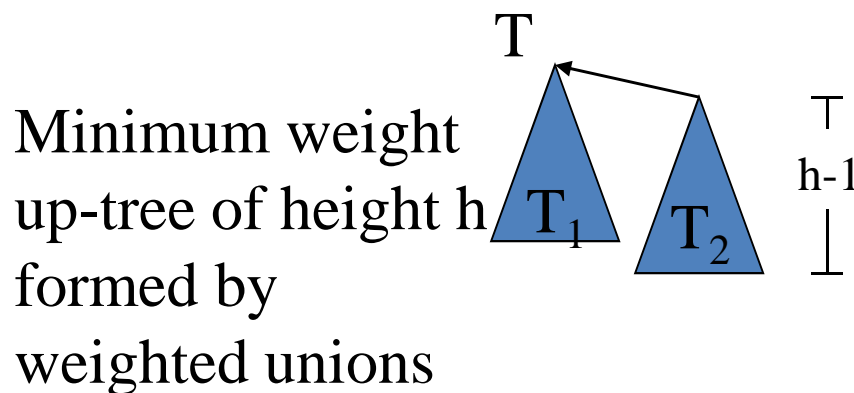

Disjoint Sets (II)

Brief Midterm Postmortem

- Heaps
- Hash tables
- Bubble sort
- Properties of Sorting Algorithms
- Merging

Analysis of Weighted Union

- With weighted union an up-tree of height h has weight at least 2^h .
- Proof by induction
 - Basis: $h = 0$. The up-tree has one node, $2^0 = 1$
 - Inductive step: Assume true for all $h' < h$.

$$W(T_1) \geq W(T_2) \geq 2^{h-1}$$

↑
↑
 Weighted union Induction hypothesis

$$W(T) \geq 2^{h-1} + 2^{h-1} = 2^h$$

Analysis of Weighted Union

- Let T be an up-tree of weight n formed by weighted union. Let h be its height.
- $n \geq 2^h$
- $\log_2 n \geq h$
- Find(x) in tree T takes $O(\log n)$ time.
- Can we do better?

Worst Case for Weighted Union

$n/2$ Weighted Unions

$n/4$ Weighted Unions

Example of Worst Cast (cont')

After $n - 1 = n/2 + n/4 + \dots + 1$ Weighted Unions

If there are $n = 2^k$ nodes then the longest path from leaf to root has length k .

Elegant Array Implementation

	1	2	3	4	5	6	7
up	0	1	0	7	7	5	0
weight	2		1				4

Weighted Union

```
W-Union(i, j : index) {  
  // i and j are roots //  
  wi := weight[i];  
  wj := weight[j];  
  if wi < wj then  
    up[i] := j;  
    weight[j] := wi + wj;  
  else  
    up[j] := i;  
    weight[i] := wi + wj;  
}
```

Path Compression

- On a Find operation point all the nodes on the search path directly to the root.

Self-Adjustment Works

PC-Find(x) →

Student Activity

Draw the result of Find(e):

Path Compression Find

```
PC-Find(i : index) {  
  r := i;  
  while up[r] ≠ 0 do //find root//  
    r := up[r];  
  if i ≠ r then //compress path//  
    k := up[i];  
    while k ≠ r do  
      up[i] := r;  
      i := k;  
      k := up[k];  
  return(r)  
}
```

Interlude: A Really Slow Function

Ackermann's function is a really big function $A(x, y)$ with inverse $\alpha(x, y)$ which is really small

How fast does $\alpha(x, y)$ grow?

$\alpha(x, y) = 4$ for x **far** larger than the number of atoms in the universe (2^{300})

α shows up in:

- Computation Geometry (surface complexity)
- Combinatorics of sequences

A More Comprehensible Slow Function

**$\log^* x$ = number of times you need to compute
log to bring value down to at most 1**

E.g. $\log^* 2 = 1$

$\log^* 4 = \log^* 2^2 = 2$

$\log^* 16 = \log^* 2^{2^2} = 3$ ($\log \log \log 16 = 1$)

$\log^* 65536 = \log^* 2^{2^{2^2}} = 4$ ($\log \log \log \log 65536 = 1$)

$\log^* 2^{65536} = \dots\dots\dots = 5$

Take this: $\alpha(m,n)$ grows even slower than $\log^* n$!!

Disjoint Union / Find with Weighted Union and PC

- Worst case time complexity for a W-Union is $O(1)$ and for a PC-Find is $O(\log n)$.
- Time complexity for $m \geq n$ operations on n elements is $O(m \log^* n)$
 - $\log^* n < 7$ for all reasonable n . Essentially constant time per operation!
- Using “ranked union” gives an even better bound theoretically.

Amortized Complexity

- For disjoint union / find with weighted union and path compression.
 - average time per operation is essentially a constant.
 - worst case time for a PC-Find is $O(\log n)$.
- An individual operation can be costly, but over time the average cost per operation is not.

Find Solutions

Recursive

```
Find(up[] : integer array, x : integer) : integer {  
  //precondition: x is in the range 1 to size//  
  if up[x] = 0 then return x  
  else return Find(up, up[x]);  
}
```

Iterative

```
Find(up[] : integer array, x : integer) : integer {  
  //precondition: x is in the range 1 to size//  
  while up[x] ≠ 0 do  
    x := up[x];  
  return x;  
}
```
