

Sorting

Chapter 7 in Weiss

Today's Outline

- **Announcements**
 - HW #5
 - Assignment due Thurs June 4th.
- **Sorting**

Why Sort?

Sorting: *The Big Picture*

Problem: Given n comparable elements in an array, sort them in an increasing (or decreasing) order.

Insertion Sort: Idea

- At the k^{th} step, put the k^{th} input element in the correct place among the first k elements
- **Result:** After the k^{th} step, the first k elements are sorted.

Runtime:

worst case :
best case :
average case :

Selection Sort: Idea

- Find **the** smallest element, put it 1st
- Find **the** next smallest element, put it 2nd
- Find **the** next smallest, put it 3rd
- And so on ...

Student Activity

```

Mystery(int array a[]) {
  for (int p = 1; p < length; p++) {
    int tmp = a[p];
    for (int j = p; j > 0 && tmp < a[j-1]; j--)
      a[j] = a[j-1];
    a[j] = tmp;
  }
}

```

What sort is this?

What is its running time?
Best?
Avg?
Worst?

6/01/09 7

Selection Sort: Code

```

void SelectionSort (Array a[0..n-1]) {
  for (i=0, i<n; ++i) {
    j = Find index of smallest entry in a[i..n-1]
    Swap(a[i],a[j])
  }
}

```

Runtime:
 worst case :
 best case :
 average case :

6/01/09 8

Student Activity

Sorts using other data structures:

| | How? | Runtime? |
|-------------|------|----------|
| AVL Sort? | | |
| Heap Sort? | | |
| Splay Sort? | | |

6/01/09 9

HeapSort: Using Priority Queue ADT (heap)

Shove all elements into a priority queue,
take them out smallest to largest.

Runtime:
 6/01/09 10

AVL Sort

Runtime:

Would the simpler “Splay sort” take any longer than this?

6/01/09 11

Merge Sort?

6/01/09 12

Merge Sort

MergeSort (Array [1..n])

1. Split Array in half
2. Recursively sort each half
3. Merge two halves together

"The 2-pointer method"

6/01/09

```

Merge (a1[1..n], a2[1..n])
i1=1, i2=1
while (i1<n, i2<n) {
  if (a1[i1] < a2[i2]) {
    Next is a1[i1]
    i1++
  } else {
    Next is a2[i2]
    i2++
  }
}
Now throw in the dregs...
    
```

13

Merge Sort: Complexity

6/01/09

14

Quick Sort

1. Pick a "pivot"
2. Divide into less-than & greater-than pivot
3. Sort each side recursively

6/01/09

15

The steps of QuickSort

6/01/09

16

QuickSort Example

- Choose the pivot as the median of three.
- Place the pivot and the largest at the right and the smallest at the left

6/01/09

17

QuickSort Example

- Move i to the right to be larger than pivot.
- Move j to the left to be smaller than pivot.
- Swap

6/01/09

18

QuickSort Example

$S_1 < \text{pivot}$ pivot $S_2 > \text{pivot}$

6/01/09 19

Recursive Quicksort

```

Quicksort(A[]: integer array, left, right : integer): {
  pivotindex : integer;
  if left + CUTOFF ≤ right then
    pivot := median3(A, left, right);
    pivotindex := Partition(A, left, right-1, pivot);
    Quicksort(A, left, pivotindex - 1);
    Quicksort(A, pivotindex + 1, right);
  else
    Insertionsort(A, left, right);
}

```

Don't use quicksort for small arrays.
 CUTOFF = 10 is reasonable.

6/01/09 20

Student Activity

Recurrence Relations

Write the recurrence relation for QuickSort:

- Best Case:
- Worst Case:

6/01/09 21

QuickSort: Best case complexity

6/01/09 22

QuickSort: Worst case complexity

6/01/09 23

QuickSort: Average case complexity

Turns out to be $O(n \log n)$

See Section 7.7.5 for an idea of the proof.
Don't need to know proof details for this course.

6/01/09 24

Features of Sorting Algorithms

- In-place
 - Sorted items occupy the same space as the original items. (No copying required, only $O(1)$ extra space if any.)
- Stable
 - Items in input with the same value end up in the same order as when they began.

6/01/09

25

Student Activity

Sort Properties

| Are the following: | stable? | | in-place? | |
|--------------------|---------|-----|-----------|-----|
| Insertion Sort? | No | Yes | No | Yes |
| Selection Sort? | No | Yes | No | Yes |
| Heap Sort? | No | Yes | No | Yes |
| MergeSort? | No | Yes | No | Yes |
| QuickSort? | No | Yes | No | Yes |

6/01/09

26

How fast can we sort?

- Heapsort, Mergesort, and Quicksort all run in $O(N \log N)$ best case running time
- Can we do any better?
- No, if the basic action is a comparison.

6/01/09

27

Sorting Model

- Recall our basic assumption: we can only compare two elements at a time
 - we can only reduce the possible solution space by half each time we make a comparison
- Suppose you are given N elements
 - Assume no duplicates
- How many possible orderings can you get?
 - Example: a, b, c ($N = 3$)

6/01/09

28

Permutations

- How many possible orderings can you get?
 - **Example:** a, b, c ($N = 3$)
 - $(a b c), (a c b), (b a c), (b c a), (c a b), (c b a)$
 - 6 orderings = $3 \cdot 2 \cdot 1 = 3!$ (ie, “3 factorial”)
 - All the possible permutations of a set of 3 elements
- For N elements
 - N choices for the first position, $(N-1)$ choices for the second position, ..., (2) choices, 1 choice
 - $N(N-1)(N-2) \cdots (2)(1) = N!$ possible orderings

6/01/09

29

Decision Tree

6/01/09

30

Lower bound on Height

- A binary tree of height h has **at most** *how many* leaves?

L

- A binary tree with L leaves has height **at least**:

h

- The decision tree has how many leaves:

- So the decision tree has height:

h_{01/09}

$\log(N!)$ is $\Omega(M \log N)$

$$\begin{aligned} \log(N!) &= \log(N \cdot (N-1) \cdot (N-2) \cdots (2) \cdot (1)) \\ &= \log N + \log(N-1) + \log(N-2) + \cdots + \log 2 + \log 1 \\ &\geq \log N + \log(N-1) + \log(N-2) + \cdots + \log \frac{N}{2} \\ &\geq \frac{N}{2} \log \frac{N}{2} \\ &\geq \frac{N}{2} (\log N - \log 2) = \frac{N}{2} \log N - \frac{N}{2} \\ &= \Omega(N \log N) \end{aligned}$$

$\Omega(N \log N)$

- Run time of any comparison-based sorting algorithm is $\Omega(N \log N)$
- Can we do better if we don't use comparisons?

BucketSort (aka BinSort, CountingSort)

If all values to be sorted are *known* to be between 1 and K , create an array `count` of size K , **increment** counts while traversing the input, and finally output the result.

Example $K=5$. Input = (5,1,3,4,3,2,1,1,5,4,5)

| count array | |
|-------------|--|
| 1 | |
| 2 | |
| 3 | |
| 4 | |
| 5 | |

Running time to sort n items?

BucketSort Complexity: $O(n+K)$

- Case 1: K is a constant
 - BinSort is linear time
- Case 2: K is variable
 - Not simply linear time
- Case 3: K is constant but large (e.g. 2^{32})
 - ???

Fixing impracticality: RadixSort

- Radix = "The base of a number system"
 - We'll use 10 for convenience, but could be anything
- Idea: BucketSort on each **digit**, least significant to most significant (lsd to msd)

Radix Sort Example (1st pass)

Input data

478
537
9
721
3
38
123
67

Bucket sort
by 1's digit

| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
|---|-----|---|-----|---|---|---|-----|-----|---|
| | 721 | | 123 | | | | 537 | 478 | 9 |

After 1st pass

721
3
123
537
67
478
38
9

This example uses B=10 and base 10 digits for simplicity of demonstration. Larger bucket counts should be used in an actual implementation.

6/01/09
37

Radix Sort Example (2nd pass)

After 1st pass

721
3
123
537
67
478
38
9

Bucket sort
by 10's digit

| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
|----------|---|------------|-----------|---|---|----|-----|---|---|
| 03 09 | | 721 123 | 537 38 | | | 67 | 478 | | |

After 2nd pass

3
9
721
123
537
38
67
478

6/01/09
38

Radix Sort Example (3rd pass)

After 2nd pass

3
9
721
123
537
38
67
478

Bucket sort
by 100's digit

| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
|--------------------------|-----|---|---|-----|-----|---|-----|---|---|
| 003 009 038 067 | 123 | | | 478 | 537 | | 721 | | |

After 3rd pass

3
9
38
67
537
721
478

Invariant: after k passes the low order k digits are sorted.

6/01/09
39

Student Activity

RadixSort

• Input: 126, 328, 636, 341, 416, 131, 328

BucketSort on lsd:

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |

BucketSort on next-higher digit:

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |

BucketSort on msd:

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |

6/01/09
40

Radixsort: Complexity

- How many passes?
- How much work per pass?
- Total time?
- Conclusion?
- In practice
 - RadixSort only good for large number of elements with relatively small values. Why?
 - Hard on the cache compared to MergeSort/QuickSort ⁴¹

6/01/09
41

Internal versus External Sorting

- Need sorting algorithms that minimize disk/tape access time
- **External sorting** – Basic Idea:
 - Load chunk of data into RAM, sort, store this “run” on disk/tape
 - Use the Merge routine from Mergesort to merge runs
 - Repeat until you have only one run (one sorted chunk)
 - Text gives some examples in section 7.10

6/01/09
