

# CSE373: Data Structures and Algorithms Lecture 1: Introduction; ADTs; Stacks/Queues

Dan Grossman Fall 2013

## Welcome!

We have 10 weeks to learn fundamental data structures and algorithms for organizing and processing information

- "Classic" data structures / algorithms and how to analyze
- rigorously their efficiency and when to use them – Queues, dictionaries, graphs, sorting, etc.

Today in class:

- Introductions and course mechanics
- What this course is about
- Start abstract data types (ADTs), stacks, and queues

   Largely review

Fall 2013

CSE373: Data Structures and Algorithms

## Concise to-do list

#### See your "first-day handout"

In next 24-48 hours:

- · Adjust class email-list settings
- Take homework 0 (worth 0 points) as Catalyst quiz
- Read all course policies
- Read/skim Chapters 1 and 3 of Weiss book
- Relevant to Homework 1, due next week
- Will start Chapter 2 fairly soon

#### Possibly:

Set up your Java environment for Homework 1

http://courses.cs.washington.edu/courses/cse373/13au/

Fall 2013

CSE373: Data Structures and Algorithms

# Course staff

Instructor: Dan Grossman TA: Luyi Lu TA: Conrad Nied TA: Nicholas Shahan TA: Jasmine Singh TA: Sam Wilson

Dan: CSE Faculty for 10 years (omg!), loves teaching

 Also loves to talk <sup>(2)</sup>, you'll surely learn lots of things about me from class

Office hours, email, etc. on course web-page

Fall 2013

CSE373: Data Structures and Algorithms

## Communication

- Course email list: cse373a\_au13@u.washington.edu
  - Students and staff already subscribed
  - You must get announcements sent there
  - Fairly low traffic
- Course staff: cse373-staff@cs.washington.edu plus individual emails
- Discussion board
  - For appropriate discussions; TAs will monitor
  - Encouraged, but won't use for important announcements
- Anonymous feedback link
  - For good and bad: if you don't tell me, I don't know

Fall 2013

3

#### Course meetings

- · Lecture (Dan)
  - Materials posted, but take notes
  - Ask questions, focus on key ideas (rarely coding details)
- Optional meetings on Tuesday/Thursday afternoons
  - Will post rough agenda roughly a day or more in advance
  - Help on programming/tool background
  - Helpful math review and example problems
  - Again, optional but helpful
  - May cancel some later in course (experimental)
- Office hours
  - Use them: please visit me
  - Ideally not just for homework questions (but that's great too)

## Trade-offs

A data structure strives to provide many useful, efficient operations

But there are unavoidable trade-offs:

- Time vs. space
- One operation more efficient if another less efficient
- Generality vs. simplicity vs. performance

We ask ourselves questions like:

- Does this support the operations I need efficiently?
- Will it be easy to use, implement, and debug?
- What assumptions am I making about how my software will be used? (E.g., more lookups or more inserts?)

Fall 2013

CSE373: Data Structures and Algorithms

#### Terminology

- Abstract Data Type (ADT) Mathematical description of a "thing" with set of operations Algorithm - A high level, language-independent description of a step-bystep process · Data structure - A specific organization of data and family of algorithms for implementing an ADT · Implementation of a data structure
  - A specific implementation in a specific language

Fall 2013 CSE373: Data Structures and Algorithms 20

### Example: Stacks

Why useful The Stack ADT supports operations: The Stack ADT is a useful abstraction because: - isEmpty: have there been same number of pops as pushes It arises all the time in programming (e.g., see Weiss 3.6.3) - push: takes an item Recursive function calls - pop: raises an error if empty, else returns most-recently Balancing symbols (parentheses) pushed item not yet returned by a pop Evaluating postfix notation: 3 4 + 5 \* ... (possibly more operations) - Clever: Infix ((3+4) \* 5) to postfix conversion (see text) • A Stack data structure could use a linked-list or an array or We can code up a reusable library something else, and associated algorithms for the operations · We can communicate in high-level terms One implementation is in the library java.util.Stack "Use a stack and push numbers, popping for operators..." - Rather than, "create a linked list and add a node when..."
