

Graph Searching

CSE 373
Data Structures & Algorithms
Linda Shapiro
Spring 2013

Today's Outline

- **Announcements:**
 - › HW 5 due Friday, May 31.
- **Today's Topics:**
 - › Weiss 9.5, 9.6

5/24/13

Graph Searching

2

Graph Searching

- **Find Properties of Graphs**
 - › Spanning trees
 - › Connected components
 - › Bipartite structure
 - › Biconnected components
- **Applications**
 - › Finding the web graph – used by Google and others
 - › Garbage collection – used in Java run time system
 - › Alternating paths for matching

5/24/13

Graph Searching

3

Graph Searching Methodology Breadth-First Search (BFS)

- **Breadth-First Search (BFS)**
 - › Use a queue to explore neighbors of source vertex, then neighbors of neighbors etc.
 - › All nodes at a given distance (in number of edges) are explored before we go further

5/24/13

Graph Searching

4

Graph Searching Methodology Depth-First Search (DFS)

- **Depth-First Search (DFS)**
 - › Searches down one path as deep as possible
 - › When no nodes available, it backtracks
 - › When backtracking, it explores side-paths that were not taken
 - › Uses a stack (instead of a queue in BFS)
 - › Allows an easy recursive implementation

5/24/13

Graph Searching

5

Depth First Search Algorithm

- Recursive marking algorithm
- Initially every vertex is unmarked

```
DFS(i: vertex)
  mark i;
  for each j adjacent to i do
    if j is unmarked then DFS(j)
  end{DFS}
```

Marks all vertices reachable from i

5/24/13

Graph Searching

6

DFS Application: Spanning Tree

- Given a (undirected) graph $G(V,E)$ a **spanning tree** of G is a graph $G'(V',E')$
 - $V' = V$, the tree touches all vertices (spans) the graph
 - E' is a subset of E such G' is connected and there is **no cycle** in G'
 - A graph is **connected** if given any two vertices u and v , there is a path from u to v

5/24/13

Graph Searching

7

Example of DFS: Graph connectivity and spanning tree

5/24/13

Graph Searching

8

Example Step 2

Red links will define the spanning tree if the graph is connected

5/24/13

Graph Searching

9

Example Step 5

5/24/13

Graph Searching

10

Example Steps 6 and 7

5/24/13

Graph Searching

11

Example Steps 8 and 9

5/24/13

Graph Searching

12

Example Step 10 (backtrack)

DFS(1)
DFS(2)
DFS(3)
DFS(4)
DFS(5)

Back to 5,
but it has no
more neighbors.

5/24/13

Graph Searching

13

Example Step 12

DFS(1)
DFS(2)
DFS(3)
DFS(4)
DFS(6)

Back up to 4.
From 4 we can
get to 6.

5/24/13

Graph Searching

14

Example Step 13

DFS(1)
DFS(2)
DFS(3)
DFS(4)
DFS(6)

From 6 there is
nowhere new
to go. Back up.

5/24/13

Graph Searching

15

Example Step 14

DFS(1)
DFS(2)
DFS(3)
DFS(4)

Back to 4.
Keep backing up.

5/24/13

Graph Searching

16

Example Step 17

DFS(1)

All the way
back to 1.
Done.

All nodes are marked so graph is connected;
red links define a spanning tree

5/24/13

Graph Searching

17

Adjacency List Implementation

Adjacency lists

M	G
0	1 → [2] → [4] → [6]
0	2 → [3] → [1] → [7]
0	3 → [4] → [5]
0	4 → [5] → [6] → [1] → [3]
0	5 → [3] → [7] → [4]
0	6 → [1] → [4]
0	7 → [5] → [2]

Graph Searching

18

Another Use for Depth First Search: Connected Components

3 connected components

5/24/13

Graph Searching

19

Connected Components

3 connected components are labeled

5/24/13

Graph Searching

20

Depth-first Search for Labeling Connected components

```

Main {
  i : integer
  for i = 1 to n do M[i] := 0; //initial label is zero
  label := 1;
  for i = 1 to n do
    if M[i] = 0 then DFS(G,M,i,label); //if i is not labeled
    label := label + 1; // then call DFS
}
DFS(G[]: node ptr array, M[]: int array, i,label: int) {
  v : node pointer;
  M[i] := label;
  v := G[i]; // first neighbor //
  while v ≠ null do // recursive call (below)
    if M[v.index] = 0 then DFS(G,M,v.index,label);
    v := v.next; // next neighbor //
}
    
```

5/24/13

Graph Searching

21

Connected Components for Image Analysis

5/24/13

22

Performance DFS

- n vertices and m edges
- Storage complexity $O(n + m)$
- Time complexity $O(n + m)$
- Linear Time!

5/24/13

Graph Searching

23

Breadth-First Search

```

BFS
Initialize Q to be empty;
Enqueue(Q,1) and mark 1;
while Q is not empty do
  i := Dequeue(Q);
  for each j adjacent to i do
    if j is not marked then
      Enqueue(Q,j) and mark j;
end{BFS}
    
```

5/24/13

Graph Searching

24

Can do Connectivity using BFS

- Uses a queue to order search

Queue = 1

5/24/13

Graph Searching

25

Beginning of example

Queue = 2,4,6

Mark while on queue
to avoid putting in
queue more than once

5/24/13

Graph Searching

26

Next

Queue = 4,6,3,7

Mark while on queue
to avoid putting in
queue more than once

5/24/13

Graph Searching

27

Next

Queue = 6,3,7,5

Mark while on queue
to avoid putting in
queue more than once

5/24/13

Graph Searching

28

Depth-First vs Breadth-First

- Depth-First
 - › Stack or recursion
 - › Many applications
- Breadth-First
 - › Queue (recursion no help)
 - › Can be used to find shortest paths from the start vertex
 - › Can be used to find short alternating paths for matching

5/24/13

Graph Searching

29

Minimum Spanning Tree

- Edges are weighted: find minimum cost spanning tree
- Applications
 - › Find cheapest way to wire your house
 - › Find minimum cost to wire a message on the Internet

5/24/13

Graph Searching
