Java 2 Collections

- A collection is an object that groups multiple elements into a single unit
- Very useful
 - » store, retrieve and manipulate data
 - » transmit data from one method to another
 - » data structures and methods pre-written by hotshots in the field

3

Collections Framework

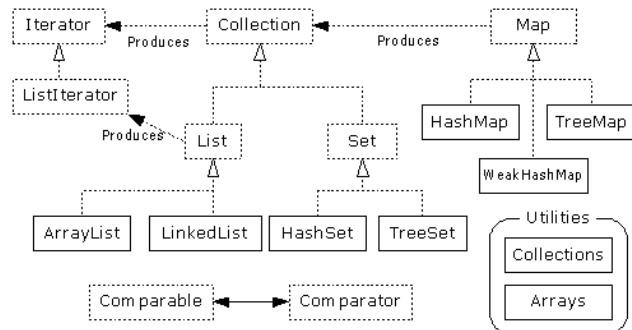

- Unified architecture for representing and manipulating collections.
- A collections framework contains three things
 - » Interfaces
 - » Implementations
 - » Algorithms

Collections Framework Diagram

5

Collection Interface

- Defines fundamental methods

```
» int size();  
» boolean isEmpty();  
» boolean contains(Object element);  
» boolean add(Object element); // Optional  
» boolean remove(Object element); // Optional  
» Iterator iterator();
```

- These methods are enough to define the basic behavior of a collection
- Provides an Iterator to step through the elements in the Collection

6

Iterator Interface

- Defines three fundamental methods
 - » `Object next()`
 - » `boolean hasNext()`
 - » `void remove()`
- These three methods provide access to the contents of the collection
- An Iterator knows position within collection
- Each call to `next()` “reads” an element from the collection
 - » Then you can use it or remove it

Example - SimpleCollection

```
public class SimpleCollection {  
    public static void main(String[] args) {  
        Collection c;  
        c = new ArrayList();  
        System.out.println(c.getClass().getName());  
        for (int i=1; i <= 10; i++) {  
            c.add(i + " * " + i + " = "+i*i);  
        }  
        Iterator iter = c.iterator();  
        while (iter.hasNext())  
            System.out.println(iter.next());  
    }  
}
```

List Interface Context

8-November-2002

cse413-15-Collections © 2002 University of Washington

10

List Interface

- The List interface adds the notion of *order* to a collection
- The user of a list has control over where an element is added in the collection
- Lists typically allow *duplicate* elements
- Provides a ListIterator to step through the elements in the list.

11

ListIterator Interface

- Extends the Iterator interface
- Defines three fundamental methods
 - » `void add(Object o)` - before current position
 - » `boolean hasPrevious()`
 - » `Object previous()`
- The addition of these three methods defines the basic behavior of an ordered list
- A ListIterator knows position within list

ArrayList and LinkedList Context

8-November-2002

cse413-15-Collections © 2002 University of Washington

14

List Implementations

- `ArrayList`
 - » low cost random access
 - » high cost insert and delete
 - » array that resizes if need be
- `LinkedList`
 - » sequential access
 - » low cost insert and delete
 - » high cost random access

8-November-2002

15

ArrayList overview

- Constant time positional access (it's an array)
- One tuning parameter, the initial capacity

```
public ArrayList(int initialCapacity) {  
    super();  
    if (initialCapacity < 0)  
        throw new IllegalArgumentException(  
            "Illegal Capacity: "+initialCapacity);  
    this.elementData = new Object[initialCapacity];  
}
```

16

ArrayList methods

- The indexed get and set methods of the List interface are appropriate to use since ArrayLists are backed by an array
 - » `Object get(int index)`
 - » `Object set(int index, Object element)`
- Indexed add and remove are provided, but can be costly if used frequently
 - » `void add(int index, Object element)`
 - » `Object remove(int index)`
- May want to resize in one shot if adding many elements
 - » `void ensureCapacity(int minCapacity)`

17

LinkedList overview

- Stores each element in a node
- Each node stores a link to the next and previous nodes
- Insertion and removal are inexpensive
 - » just update the links in the surrounding nodes
- Linear traversal is inexpensive
- Random access is expensive
 - » Start from beginning or end and traverse each node while counting

18

LinkedList entries

```
private static class Entry {  
    Object element;  
    Entry next;  
    Entry previous;  
  
    Entry(Object element, Entry next, Entry previous) {  
        this.element = element;  
        this.next = next;  
        this.previous = previous;  
    }  
  
    private Entry header = new Entry(null, null, null);  
  
    public LinkedList() {  
        header.next = header.previous = header;  
    }  
}
```

19

LinkedList methods

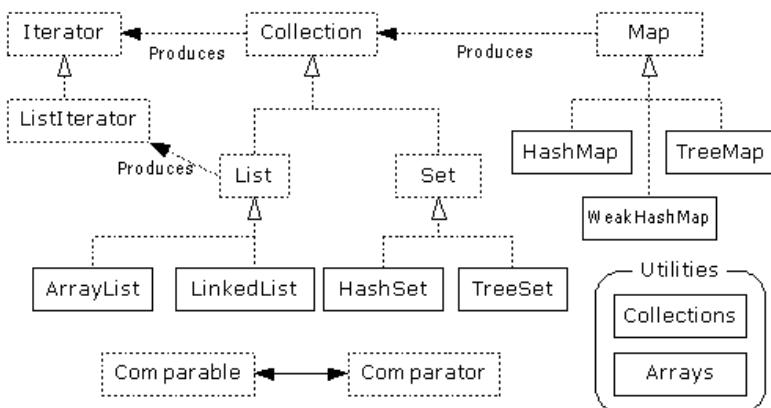

- The list is sequential, so access it that way
 - » `ListIterator listIterator()`
- ListIterator knows about position
 - » use `add()` from ListIterator to add at a position
 - » use `remove()` from ListIterator to remove at a position
- LinkedList knows a few things too
 - » `void addFirst(Object o), void addLast(Object o)`
 - » `Object getFirst(), Object getLast()`
 - » `Object removeFirst(), Object removeLast()`

20

Set Interface Context

8-November-2002

cse413-15-Collections © 2002 University of Washington

21

Set Interface

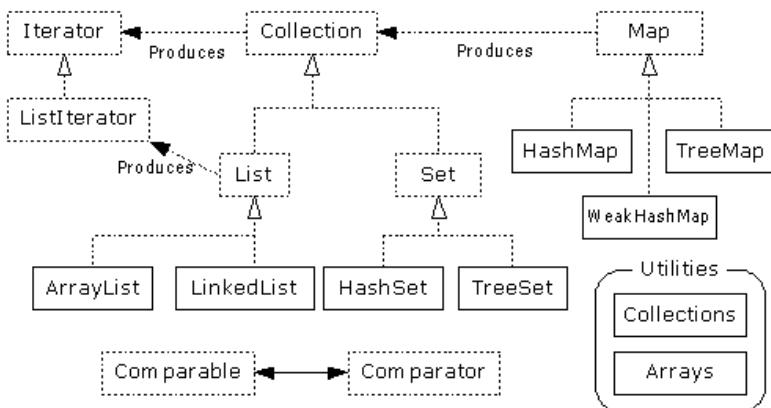

- Same methods as Collection
 - » different contract - no duplicate entries
- Defines two fundamental methods
 - » `boolean add(Object o)` - reject duplicates
 - » `Iterator iterator()`
- Provides an Iterator to step through the elements in the Set
 - » No guaranteed order in the basic Set interface
 - » There is a SortedSet interface that extends Set

8-November-2002

cse413-15-Collections © 2002 University of Washington

22

HashSet and TreeSet Context

8-November-2002

cse413-15-Collections © 2002 University of Washington

23

HashSet

- Find and add elements very quickly
- Hashing uses an array of linked lists
 - » The `hashCode()` is used to index into the array
 - » Then `equals()` is used to determine if element is in the (short) list of elements at that index
- No order imposed on elements
- The `hashCode()` method and the `equals()` method must be compatible
 - » if two objects are equal, they must have the same `hashCode()` value

8-November-2002

cse413-15-Collections © 2002 University of Washington

24

TreeSet

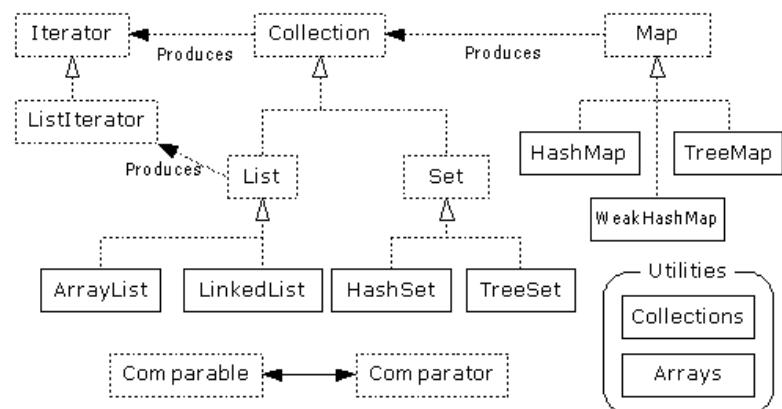

- Set with all elements in order
- Elements can be inserted in any order
- The TreeSet stores them in order
- An iterator always presents them in order
- Default order is defined by natural order
 - » objects implement the Comparable interface
 - » TreeSet uses `compareTo(Object o)` to sort
- Can use a different Comparator
 - » provide Comparator to the TreeSet constructor

25

Map Interface Context

8-November-2002

cse413-15-Collections © 2002 University of Washington

26

Map Interface

- Stores key/value pairs
- Maps from the key to the value
- Keys are unique
 - » keys are stored as a Set
 - » a key can map to only one value
- Values do not have to be unique

8-November-2002

cse413-15-Collections © 2002 University of Washington

27

Map methods

```
Object put(Object key, Object value)
Object get(Object key)
Object remove(Object key)
boolean containsKey(Object key)
boolean containsValue(Object value)
int size()
boolean isEmpty()
```

28

Map views

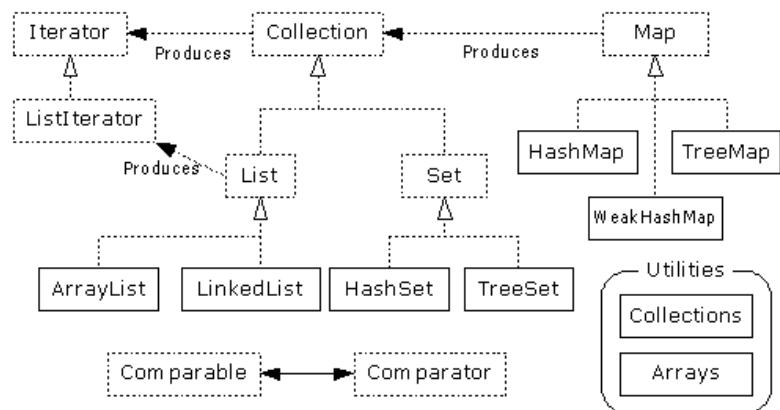

- A means of iterating over the keys and values in a Map
- **Set keySet()**
 - » returns the Set of keys contained in the Map
- **Collection values()**
 - » returns the Collection of values contained in the Map. This Collection is not a Set, as multiple keys can map to the same value.
- **Set entrySet()**
 - » returns the Set of key-value pairs contained in the Map. The Map interface provides a small nested interface called Map.Entry that is the type of the elements in this Set.

29

HashMap and TreeMap Context

8-November-2002

cse413-15-Collections © 2002 University of Washington

30

HashMap and TreeMap

- **HashMap**
 - » The keys are stored in a HashSet
 - » Fast
 - » No implicit key ordering
- **TreeMap**
 - » The keys are stored in a TreeSet
 - » Same options for ordering as a TreeSet
 - Natural order (Comparable, compareTo(Object))*
 - Special order (Comparator, compare(Object, Object))*

31

Bulk Operations

- In addition to the basic operations, a Collection may provide “bulk” operations

```
boolean containsAll(Collection c);  
boolean addAll(Collection c); // Optional  
boolean removeAll(Collection c); // Optional  
boolean retainAll(Collection c); // Optional  
void clear(); // Optional  
Object[] toArray();  
Object[] toArray(Object a[]);
```

32

Utilities

- The Collections class provides a number of static methods for fundamental algorithms
- Most operate on Lists, some on all Collections
 - » Sort, Search, Shuffle
 - » Reverse, fill, copy
 - » Min, max
- Wrappers
 - » synchronized Collections, Lists, Sets, etc
 - » unmodifiable Collections, Lists, Sets, etc

More Legacy classes

- Vector
 - » use ArrayList

36

Properties class

- Located in `java.util` package
- Special case of `Hashtable`
 - » Keys and values are `Strings`
 - » Tables can be saved to/loaded from file

System properties

- Java VM maintains set of properties that define system environment
 - » Set when VM is initialized
 - » Includes information about current user, VM version, Java environment, and OS configuration

```
Properties prop = System.getProperties();
Enumeration e = prop.propertyNames();
while (e.hasMoreElements()) {
    String key = (String) e.nextElement();
    System.out.println(key + " value is " +
        prop.getProperty(key));
}
```
