CSE 421
Introduction to Algorithms

Lecture 12, Winter 2024

Dynamic Programming

1

Announcements

- Dynamic Programming Reading:
  - 6.1-6.2, Weighted Interval Scheduling
  - 6.4 Knapsack and Subset Sum
  - 6.6 String Alignment
    - 6.7* String Alignment in linear space
  - 6.8 Shortest Paths (again)
  - 6.9 Negative cost cycles
    - How to make an infinite amount of money

2

Dynamic Programming

- The most important algorithmic technique covered in CSE 421
- Key ideas
  - Express solution in terms of a polynomial number of sub problems
  - Order sub problems to avoid recomputation

3

Recursion vs Iteration

```
Factorial(n){
    if (n <= 1)
        return 1;
    else
        return n*Factorial(n-1);
}
```

```
Factorial(n){
    v = 1;
    for (i = 2; i <= n; i++)
        v = v*i
    return v;
}
```

4! = 4 · 3!
= 4 · 3 · 2!
= 4 · 3 · 2 · 1!
= 4 · 3 · 2 · 1
= 4 · 3 · 2 · 1

4

Counting Rabbits

0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, 233, 377, 610, 987, 1597, 2584, . . .

$F_0 = 0; \quad F_1 = 1; \quad F_n = F_{n-1} + F_{n-2}$

```
Fib(n){
   if (n =  0)
       return 0;
   else if (n = 1)
       return 1;
   else
       return Fib(n-1) + Fib(n-2);
}
```

Fibonacci with Memoization

```
Fib(n){
    if (n ==  0)
        return 0;
    else if (n == 1)
        return 1;
    else
        return Fib(n-1) + Fib(n-2);
}
```

Reordering computation

```
Fib(n){
   int[ ] F = new [n+1]

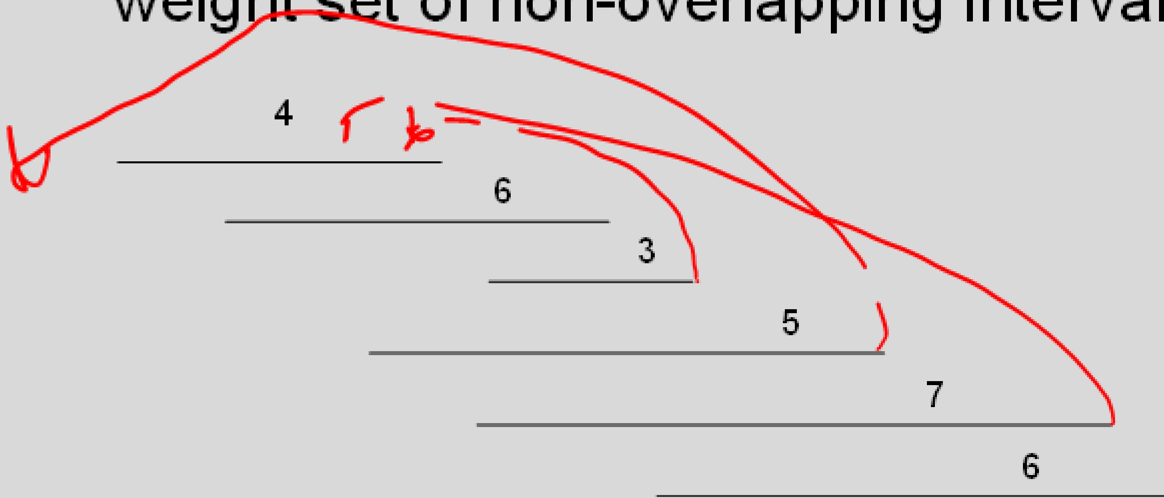
   F[0] = 0;
   F[1] = 1;
   for (i = 2; i <= n; i++)
       F[i] = F[i-1] + F[i-2];
   return F[n];
}
```

8

Intervals sorted by end time

Dynamic Programming

- Weighted Interval Scheduling
- Given a collection of intervals $I_1, \ldots, I_n$ with weights $w_1, \ldots, w_n$, choose a maximum weight set of non-overlapping intervals



Intervals sorted by end time

Optimality Condition

- Opt[j] is the maximum weight independent set of intervals $I_1, I_2, \ldots, I_j$
- Opt[j] = max(Opt[j – 1], w_j + Opt[p[j]])
  - Where p[j] is the index of the last interval which finishes before I_j starts

10

Algorithm

MaxValue(j) =
  if j = 0 return 0
  else
    return max(MaxValue(j-1),
        w_j + MaxValue(p[j]))

Worst case run time: 2^n

11

A better algorithm

M[j] initialized to -1 before the first recursive call for all j

```
MaxValue(j) =
    if j = 0 return 0;
    else if M[ j ] != -1 return M[ j ];
    else {
        M[ j ] = max(MaxValue(j-1), w_j + MaxValue(p[ j ]));
        return M[ j ];
    }
```

12

Iterative Algorithm

```
MaxValue(n){
    int[ ] M = new int[n+1];

    M[0] = 0;

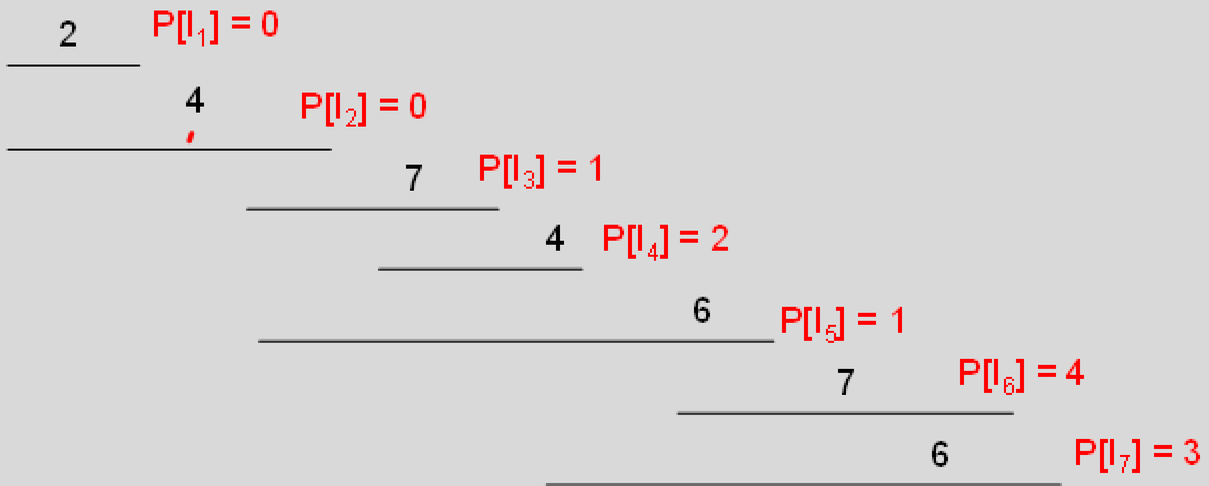
    for (int i = 1; i <= n; i++){
        M[ j ] = max(M[j-1], w_j + M[p[ j ]]);
    }

    return M[n];
}
```

13

Fill in the array with the Opt values

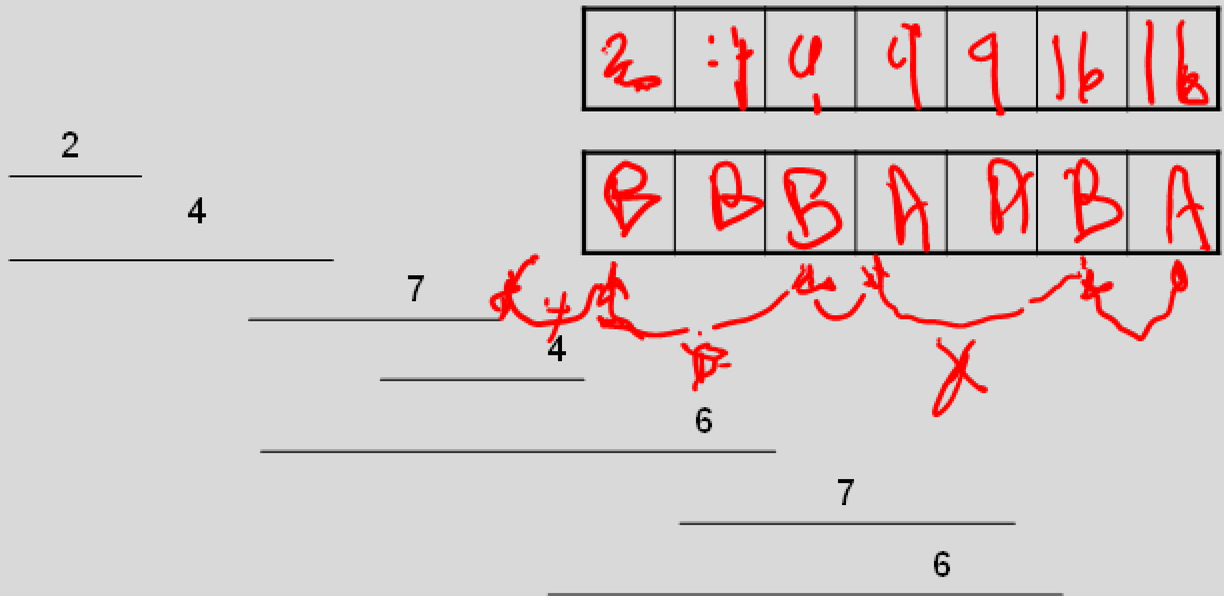
$$\mathrm{Opt}[j] = \max(\mathrm{Opt}[j-1], w_j + \mathrm{Opt}[p[j]])$$



Computing the solution

Opt[j] = max (Opt[j – 1], w_j + Opt[p[j]])

Record which case is used in Opt computation



Iterative Algorithm

```
int[] M = new int[n+1];
char[] R = new char[n+1];

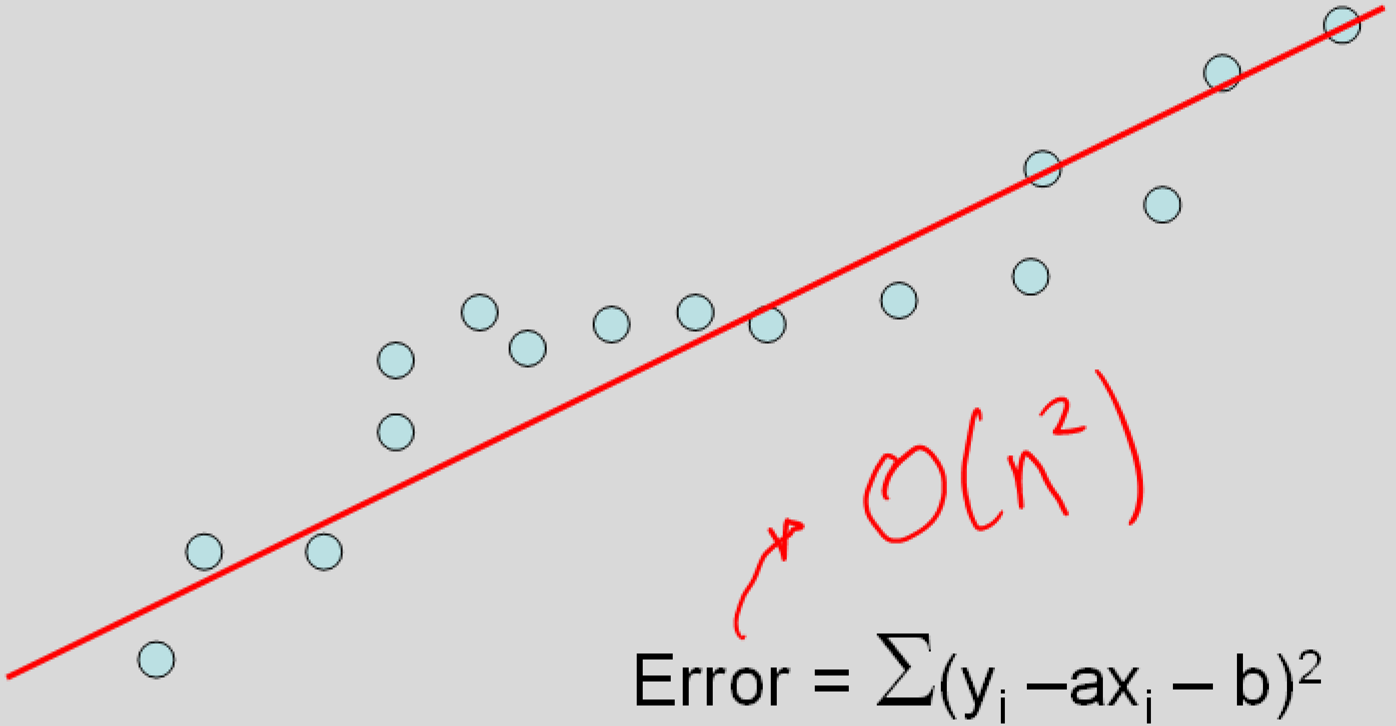
M[0] = 0;
for (int j = 1; j < n+1; j++){
       v1 = M[j-1];
       v2 = W[j] + M[P[j]];
       if (v1 > v2) {
              M[j] = v1;
              R[j] = 'A';
       }
       else {
              M[j] = v2;
              R[j] = 'B';
       }
}
```

16

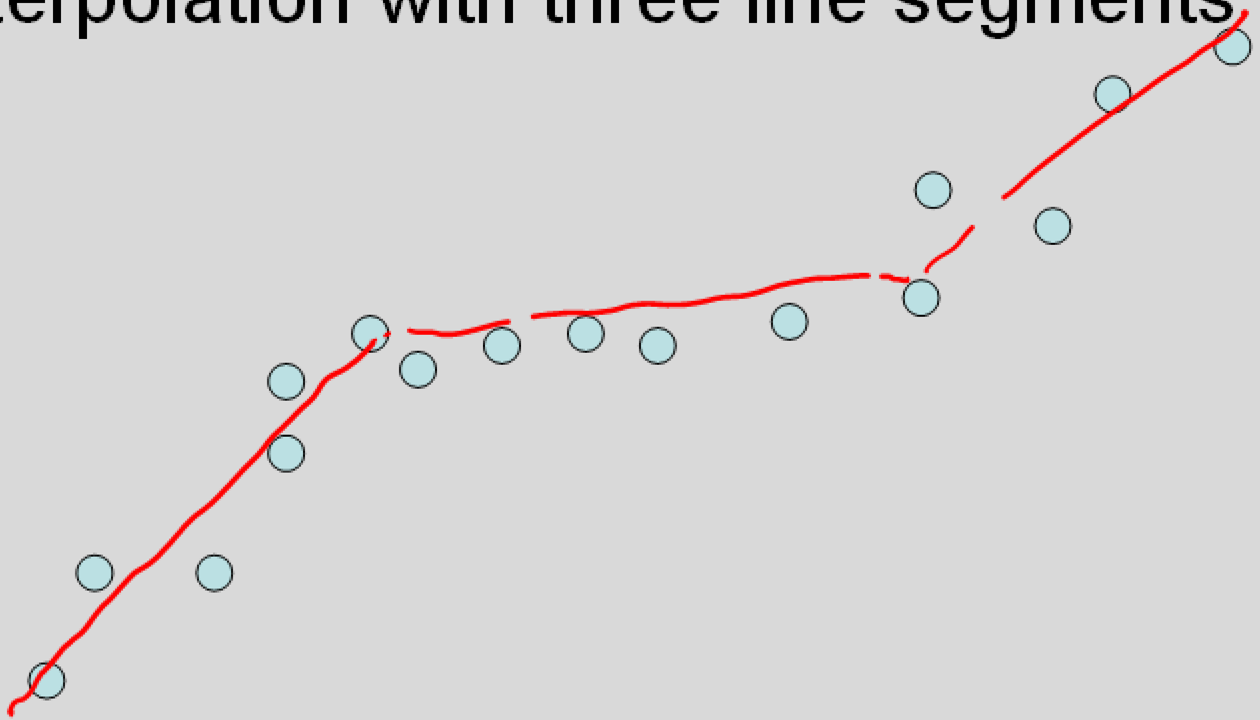
Algorithm Summary

- O(n) time algorithm for finding maximum weight independent set of intervals
- Key idea: Creating an Opt function to express optimal set of $I_1, I_2, \ldots I_k$ in terms of optimal set of $I_1, I_2, \ldots I_{k-1}$
- Organize computation to avoid recomputation

17

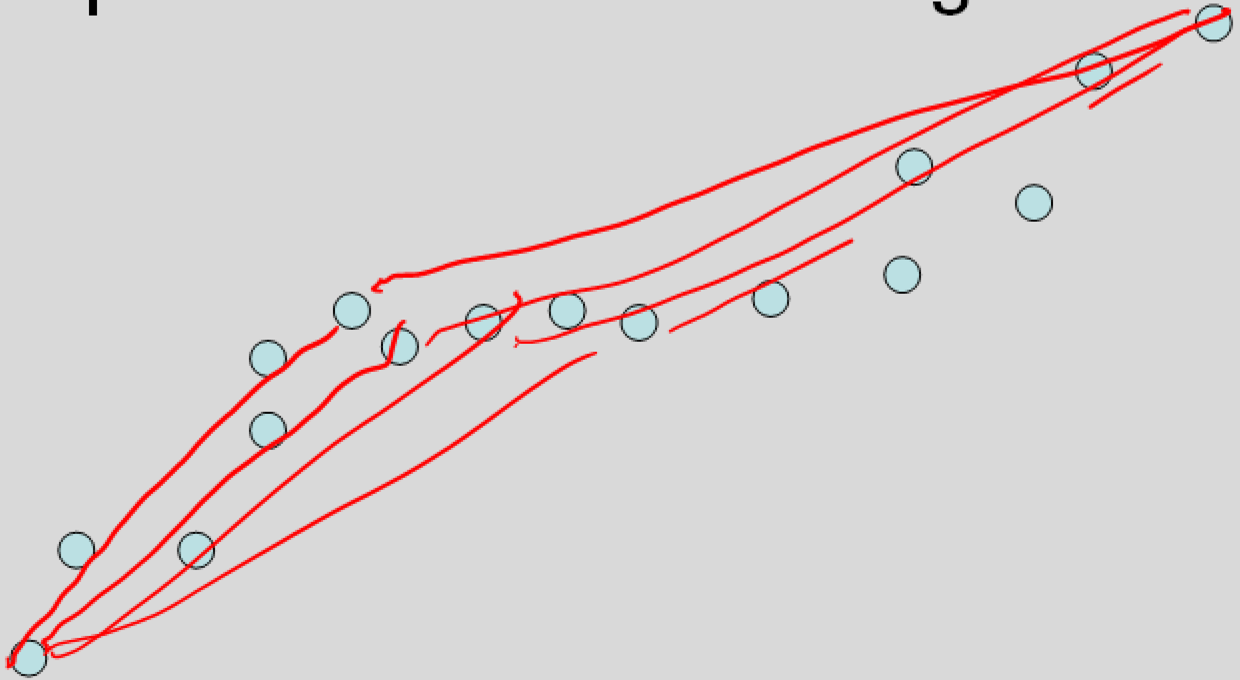


Optimal linear interpolation
O(n²)
Error = $\sum(y_i - ax_i - b)^2$
18



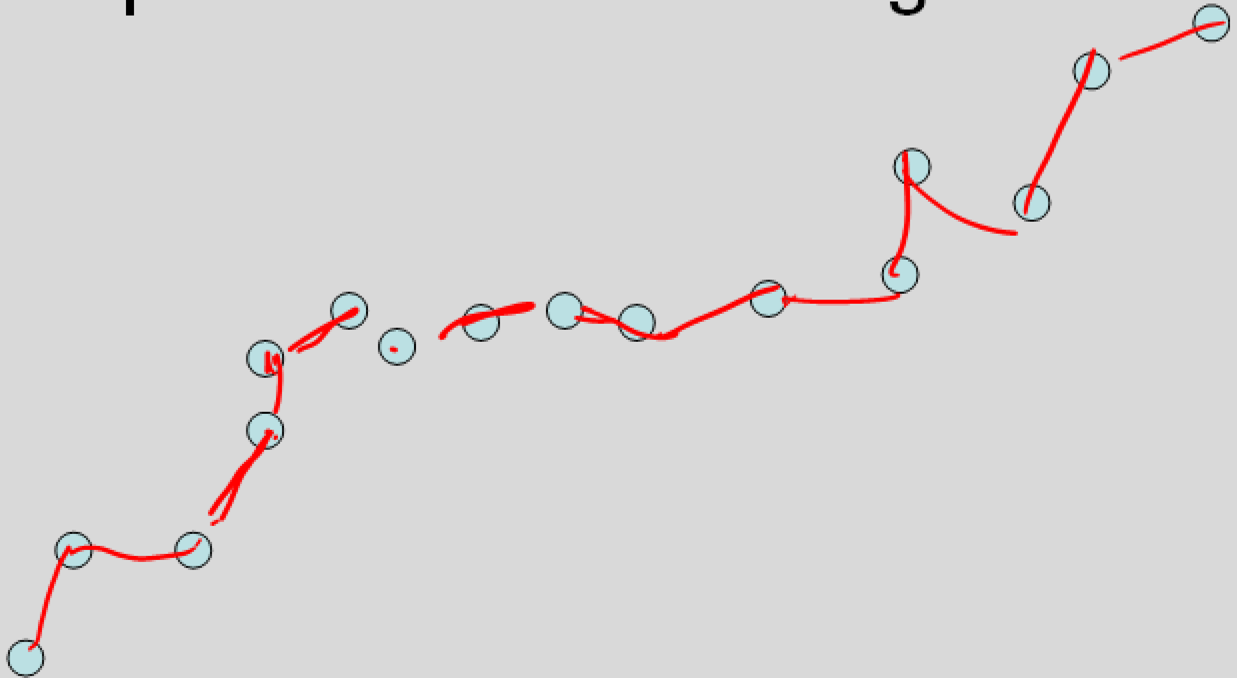
What is the optimal linear interpolation with three line segments
19

What is the optimal linear interpolation with two line segments



20

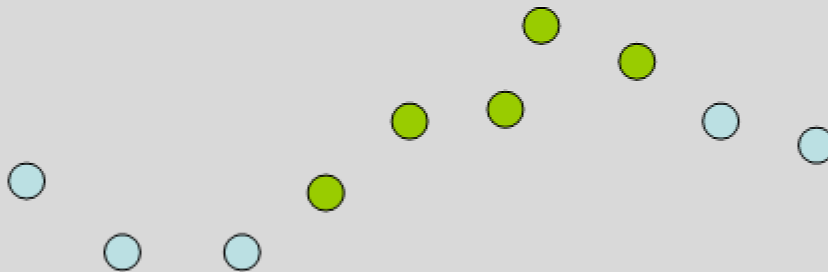
What is the optimal linear interpolation with n line segments



21

Notation

- Points $p_1, p_2, \ldots, p_n$ ordered by x-coordinate ($p_i = (x_i, y_i)$)
- $E_{i,j}$ is the least squares error for the optimal line interpolating $p_i, \ldots p_j$



22

Optimal interpolation with two segments

- Give an equation for the optimal interpolation of $p_1, \ldots, p_n$ with two line segments

$$Opt = \min_j E_{1j} + E_{jn}$$

- $E_{i,j}$ is the least squares error for the optimal line interpolating $p_i, \ldots p_j$

23

Optimal interpolation with k segments

- Optimal segmentation with three segments
  - $Min_{i,j}\{E_{1,i} + E_{i,j} + E_{j,n}\}$
  - $O(n^2)$ combinations considered
- Generalization to k segments leads to considering $O(n^{k-1})$ combinations

24

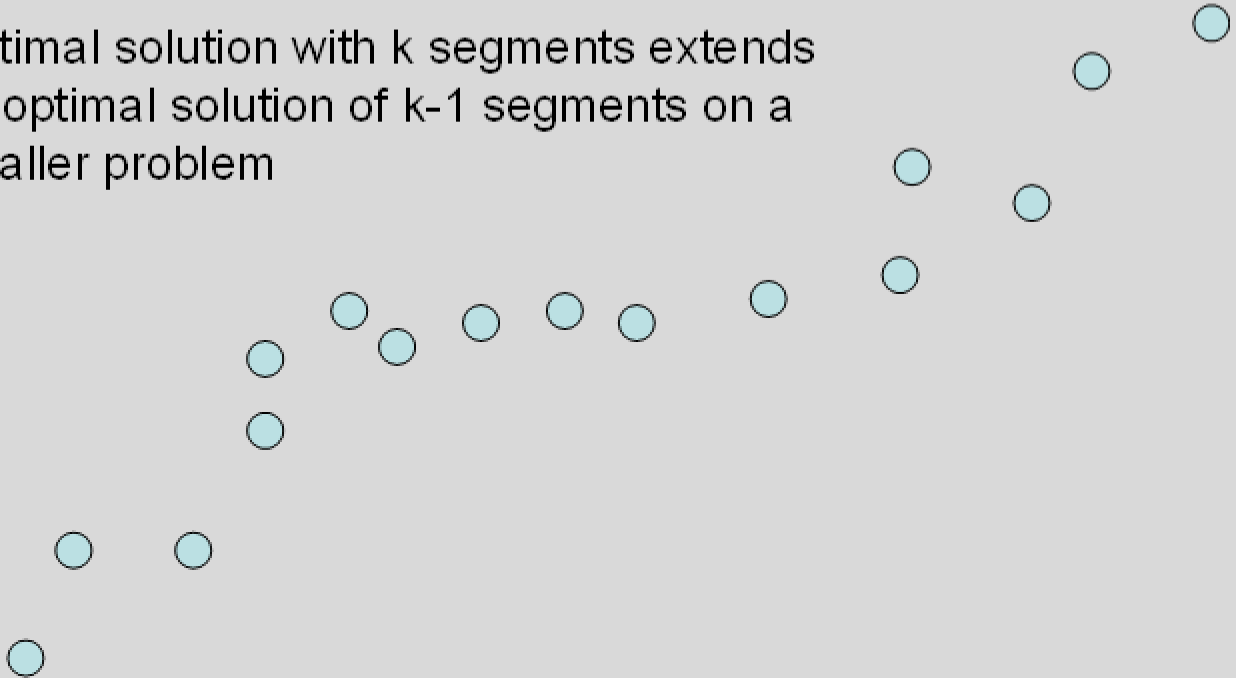
$Opt_k[\ j\ ]$: Minimum error approximating $p_1 \ldots p_j$ with k segments

How do you express $Opt_k[\ j\ ]$ in terms of $Opt_{k-1}[1], \ldots, Opt_{k-1}[\ j\ ]$?

25

Optimal sub-solution property

Optimal solution with k segments extends an optimal solution of k-1 segments on a smaller problem



Optimal multi-segment interpolation

Compute Opt[k, j] for $0 < k < j < n$

```
for j := 1 to n
    Opt[ 1, j] = E_{1,j};
for k := 2 to n-1
    for j := 2 to n
        t := E_{1,j}
        for i := 1 to j -1
            t = min (t, Opt[k-1, i ] + E_{i,j})
        Opt[k, j] = t
```

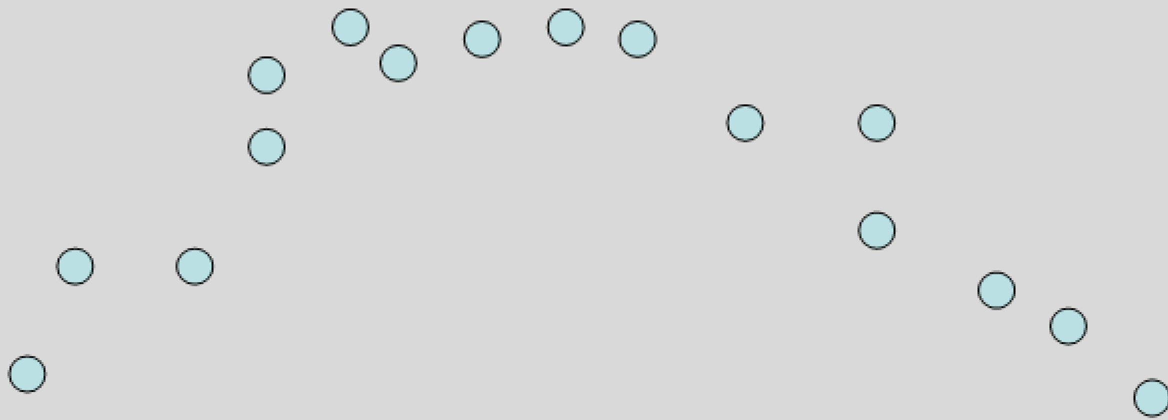
Determining the solution

- When Opt[k,j] is computed, record the value of i that minimized the sum
- Store this value in a auxiliary array
- Use to reconstruct solution

28

Variable number of segments

- Segments not specified in advance
- Penalty function associated with segments
- Cost = Interpolation error + C x #Segments



29

Penalty cost measure

- $Opt[\ j\ ] = \min(E_{1,j}, \min_i(Opt[\ i\ ] + E_{i,j} + P))$
