

# Lecture 26

# Coping with NP-Completeness

Is your real problem a special subcase?

E.g. 3-SAT is NP-complete, but 2-SAT is not; ditto 3- vs 2-coloring

E.g. you only need planar graphs, or degree 3 graphs, ...?

Guaranteed approximation good enough?

E.g. Euclidean TSP within  $2 * \text{Opt}$  in poly time

Fast enough in practice (esp. if  $n$  is small),

E.g. clever exhaustive search like backtrack, branch & bound, pruning

Heuristics – usually a good approximation and/or usually fast

# NP-complete problem: TSP

Input: An undirected graph  $G=(V,E)$  with integer edge weights, and an integer  $b$ .

Output: YES iff there is a simple cycle in  $G$  passing through all vertices (once), with total cost  $\leq b$ .

Example:

$b = 34$

# TSP - Nearest Neighbor Heuristic

NN Heuristic –go to nearest unvisited vertex

Fact: NN tour can be about  $(\log n)$  x opt, i.e.

$$\lim_{n \rightarrow \infty} \frac{NN}{OPT} \rightarrow \infty$$

(above example is not that bad)

# 2x Approximation to Euclidean TSP

A TSP tour visits all vertices, so contains a spanning tree, so TSP cost is  $>$  cost of min spanning tree.

Find MST

Find “DFS” Tour

Shortcut

$$\text{TSP} \leq \text{shortcut} < \text{DFST} = 2 * \text{MST} < 2 * \text{TSP}$$

# Summary

Big-O – good

P – good

Exp – bad

Exp, but hints help? NP

NP-hard, NP-complete – bad (I bet)

To show NP-complete – reductions

NP-complete = hopeless? – no, but you  
need to lower your expectations:  
heuristics & approximations.

# Beyond NP

Many complexity classes are worse, e.g. time  $2^{2^n}$ ,  $2^{2^{2^n}}$ , ...

Others seem to be “worse” in a different sense, e.g., not in NP, but still exponential time. E.g., let

$L_p = \{ \langle x, y \rangle \mid y \text{ satisfies formula } x \}$ ,  $\in P$

Then :

$$\text{SAT} = \{ x \mid \exists y \langle x, y \rangle \in L_p \}$$

$$\text{UNSAT} = \{ x \mid \forall y \langle x, y \rangle \notin L_p \}$$

$$\text{QBF}_k = \{ x \mid \exists y_1 \forall y_2 \exists y_3 \dots \mathcal{Q}_k \langle x, y_1 \dots y_k \rangle \in L_p \}$$

$$\text{QBF}_\infty = \{ x \mid \exists y_1 \forall y_2 \exists y_3 \dots \langle x, y_1 \dots \rangle \in L_p \}$$
