- Design based on a top retailer's site
- In study, user could not get by this screen, why?
- Color deficiency
 - can't distinguish between red & green
- How to fix?
 - redundant cues

User Interface Design, Prototyping, and Evaluation

Human Abilities: Vision & Cognition

Prof. James A. Landay
 University of Washington
 Autumn 2008

October 21, 2008

Outline

- Review
- Human visual system
- Guidelines for design
- Models of human performance (MHP)
- Memory

CSE 440 – Autumn 2008 User Interface Design, Prototyping, and Evaluation 5

Video Prototype Review

- Prototype dimensions
 - representation, precision, interactivity, evolution
- Video prototypes illustrate how customers will interact w/ system
 - quick to build, inexpensive, shows context of use
- How to create a video prototype
 - create use scenario in words
 - develop storyboard of each action/event w/ annotations explaining what is happening in scene. Put each element on a card.
 - shoot a video clip for each storyboard card
 - use title cards to separate clips

CSE 440 – Autumn 2008 User Interface Design, Prototyping, and Evaluation 6

Why Study Color?

- 1) Color can be a powerful tool to *improve* user interfaces by communicating key information
- 2) Inappropriate use of color can severely *reduce the performance* of systems we build

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

7

Visible Spectrum

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

8

Human Visual System

- Light passes through lens
- Focussed on retina

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

9

Retina

- Retina covered with light-sensitive receptors,
 - rods
 - primarily for night vision & perceiving movement
 - sensitive to broad spectrum of light
 - can't discriminate between colors
 - sense intensity or shades of gray
 - cones
 - used to sense color

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

10

Retina

- Center of retina has most of the →
 - allows for high acuity of objects focused at center
- Edge of retina is dominated by →
 - allows detecting motion of threats in periphery

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

11

Color Perception via Cones

- “Photopigments” used to sense color
- 3 types: blue, green, “red” (really yellow)
 - each sensitive to different band of spectrum
 - ratio of neural activity of the 3 → color
 - other colors are perceived by combining stimulation

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

12

Color Sensitivity

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

13

Color Sensitivity

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

14

Distribution of Photopigments

- Not distributed evenly – mainly reds (64%) & very few blues (4%) →?
 - insensitivity to short wavelengths (blue)
- No blue cones in retina center (high acuity) →?
 - “disappearance” of small blue objects you fixate on
- As we age lens yellows & absorbs shorter wavelengths →?
 - sensitivity to blue is even more reduced
- Implication
 - don't rely on blue for text or small objects!

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

15

Color Sensitivity & Image Detection

- Most sensitive to the center of the spectrum
 - blues & reds must be brighter than greens & yellows
- Brightness determined mainly by R+G
 - we use brightness & color differences
- Implication
 - hard to deal w/ blue edges & shapes

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

16

Focus

- Different wavelengths of light focused at different distances behind eye's lens
 - need for constant refocusing → ?
 - causes fatigue
 - be careful about color combinations
- Pure (saturated) colors require more focusing than less pure (desaturated)
 - don't use saturated colors in UIs unless you really need something to stand out (stop sign)

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

17

Color Deficiency (AKA “color blindness”)

- Trouble discriminating colors
 - besets about 9% of population
- Two main types
 - *different photopigment response* most common
 - reduces capability to discern small color diffs
 - *red-green deficiency* is best known
 - lack of either green or red photopigment → can't discriminate colors dependent on R & G

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

18

Color Guidelines

- Avoid simultaneous display of highly saturated, spectrally extreme colors
 - e.g., no cyans/blues at the same time as reds, why?
 - refocusing!
 - desaturated combinations are better → pastels

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

19

Using the Hue Circle

- Pick non-adjacent colors
 - opponent colors go well together
 - (red & green) or (yellow & blue)

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

20

Color Guidelines (cont.)

- Size of detectable changes in color varies
 - hard to detect changes in reds, purples, & greens
 - easier to detect changes in yellows & blue-greens
 - older users need higher brightness levels
- Hard to focus on edges created by only color
 - use both brightness & color differences
- Avoid red & green in the periphery (no RG cones)
- Avoid pure blue for text, lines, & small shapes
 - also avoid adjacent colors that differ only in blue
- Avoid single-color distinctions
 - mixtures of colors should differ in 2 or 3 colors
 - helps color-deficient observers

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

21

One Minute Break

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

22

Why Model Human Performance?

- To test understanding
- To predict influence of new technology

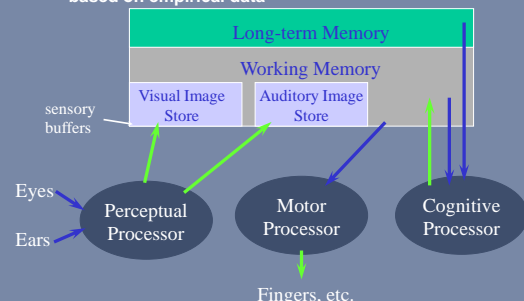

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

23

The Model Human Processor

- Developed by Card, Moran, & Newell ('83)
 - based on empirical data

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

24

MHP Basics

- Sometimes serial, sometimes parallel
 - serial in action & parallel in recognition
 - pressing key in response to light
 - driving, reading signs, & hearing at once
- Parameters
 - processors have cycle time (T) ~ 100-200 ms
 - memories have capacity, decay time, & type

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

25

What is missing from MHP?

- Haptic memory
 - for touch
- Moving from sensory memory to WM
 - attention filters stimuli & passes to WM
- Moving from WM to LTM
 - elaboration

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

26

Memory

- Working memory (short term)
 - small capacity (7 ± 2 “chunks”)
 - 6174591765 vs. (617) 459-1765
 - DECIBMGMC vs. DEC IBM GMC
 - rapid access (~ 70ms) & decay (~200 ms)
 - pass to LTM after a few seconds of continued storage
- Long-term memory
 - huge (if not “unlimited”)
 - slower access time (~100 ms) w/ little decay

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

27

MHP Principles of Operation

- Recognize-Act Cycle of the CP
 - on each cycle contents in WM initiate actions associatively linked to them in LTM
 - actions modify the contents of WM
- Discrimination Principle
 - retrieval is determined by candidates that exist in memory relative to retrieval cues
 - interference by strongly activated chunks

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

28

Principles of Operation (cont.)

- Fitts' Law
 - moving hand is a series of microcorrections
 - correction takes $T_p + T_c + T_m = 240$ msec
 - time T_{pos} to move the hand to target size S which is distance D away is given by:
 - $T_{pos} = a + b \log_2 (D/S + 1)$
 - summary
 - time to move the hand depends only on the *relative precision* required

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

29

Fitts' Law Example

Pop-up Linear Menu

Pop-up Pie Menu

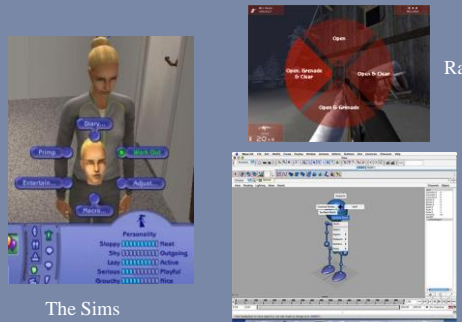

- Which will be faster on average?
 - pie menu (bigger targets & less distance)

CSE 440 – Autumn 2008

User Interface Design, Prototyping, and Evaluation

30

Pie Menus in Use Today

Two screenshots illustrating pie menus. The top one shows a character in a game with a red pie menu containing options like 'Open', 'Open to Close', and 'Open to Collapse'. The bottom one shows a character in 'The Sims' with a pie menu containing options like 'Sleep', 'Primp', 'Enter', 'Adjust', and 'Remove'.

Rainbow 6

The Sims

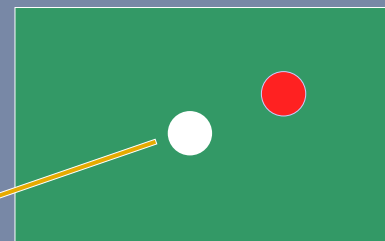

CSE 440 – Autumn 2008 User Interface Design, Prototyping, and Evaluation 31

Perception

- Stimuli that occur within one PP cycle fuse into a single concept
 - frame rate needed for movies to look real?
 - time for 1 frame < T_p (100 msec) → 10 frame/sec.
- Perceptual causality
 - two distinct stimuli can fuse if the first event appears to *cause* the other
 - events must occur in the same cycle

CSE 440 – Autumn 2008 User Interface Design, Prototyping, and Evaluation 32

Perceptual Causality

A diagram showing a green square background. A white cue ball is moving from the left towards a red ball. A yellow and orange line indicates the cue ball's path. The red ball is positioned to the right of the cue ball.

- How soon must red ball move after cue ball collides with it?
 - must move in < T_p (100 msec)

CSE 440 – Autumn 2008 User Interface Design, Prototyping, and Evaluation 33

Simple Experiment

- Volunteer
- Start saying **colors** you see in list of words
 - when slide comes up
 - as fast as you can
- Say “done” when finished
- Everyone else time it...

Green

Memory

- Interference
 - two strong cues in working memory
 - link to different chunks in long term memory
- Why learn about memory?
 - know what's behind many HCI techniques
 - helps you understand what users will “get”
 - aging population of users

Stage Theory

- Working memory is small & temporary
- Maintenance rehearsal – rote repetition
 - not enough to learn information well
- Chunking / elaboration moves to LTM
 - remember by organizing & relating to already learned items

Design UIs for Recognition over Recall

- Recall
 - info reproduced from memory
 - e.g., command name & semantics
- Recognition
 - presentation of info provides knowledge that info has been seen before
 - e.g., command in menu reminds you of semantics
 - easier because of cues to retrieval
 - cue is anything related to item or situation where learned
 - e.g., giving hints, icons, labels, menu names, etc.

Human Abilities Summary

- Color can be helpful, but pay attention to
 - how colors combine
 - limitations of human perception
 - people with color deficiency
- Model Human Processor
 - perceptual, motor, cognitive processors + memory
 - model allows us to make predictions
 - e.g., perceive distinct events in same cycle as one
- Memory
 - three types: sensor, WM, & LTM
 - interference can make hard to access LTM
 - cues in WM can make it easier to access LTM
- Key time to remember: 100 ms
