

## Project Groups

The groups for the projects this quarter have been set. Please see list below; find your CSE userid, check that your group is correct, and also note your group name (“cse451X”, for some X in a - p). If we made any mistakes when putting your group together, please contact us right away.

We’ve created project directories for each group, which can be accessed from attu as well as forkbomb (the dedicated server for this class). There are sixteen lettered directories under:

```
/projects/instr/12sp/cse451/
```

Everybody in your group should have read/write access to your group’s directory; if you find that this is not the case, let us know.

You’ll want to set up a source code repository for sharing project code between your group members. Your group project directory is the right place to do this, or you can use a web-based service if you’d like (as long as it’s private). There has already been some discussion of repositories on the discussion board, here: <https://catalyst.uw.edu/gopost/conversation/lazowska/638214>. If you’re comfortable setting up a repository on your own, then you can do so right away; otherwise, we’ll post an updated tutorial on the course web page later this week.

Finally, PLEASE take care to only check source code files into your repository, and not built object files or kernel images. This will save disk space (if you’re using the project directory for the repository), as well as prevent headaches when updating your repository copies. If you have any questions or problems about this, please post on the discussion board.
