# Motion Estimation

Readings: Ch 9: 9.1-9.3 plus papers

- change detection
- optical flow analysis
- Lucas-Kanade method with pyramid structure
- Ming Ye's improved method

# Why estimate motion?

---

We live in a 4-D world

Wide applications

- Object Tracking
- Camera Stabilization
- Image Mosaics
- 3D Shape Reconstruction (SFM)
- Special Effects (Match Move)

# Frame from an ARDA Sample Video

---

# Change detection for surveillance

---

- Video frames:  $F_1, F_2, F_3, \dots$
- Objects appear, move, disappear
- Background pixels remain the same (simple case)

- How do you detect the moving objects?
- Simple answer: pixelwise subtraction

# Example: Person detected entering room

---

- Pixel changes detected as difference components
- Regions are (1) person, (2) opened door, and (3) computer monitor.
- System can know about the door and monitor. Only the person region is “unexpected”.

# Change Detection via Image Subtraction

---

for each pixel  $[r,c]$

if  $(|I1[r,c] - I2[r,c]| > \text{threshold})$  then  $I_{out}[r,c] = 1$  else  $I_{out}[r,c] = 0$

Perform **connected components** on  $I_{out}$ .

**Remove small regions.**

Perform a **closing** with a small disk for merging close neighbors.

Compute and return the **bounding boxes**  $B$  of each remaining region.

**What assumption does this make about the changes?**

# Change analysis

---

Known regions are ignored and system attends to the unexpected region of change. Region has bounding box similar to that of a person. System might then zoom in on “head” area and attempt face recognition.

# Optical flow

---

# Problem definition: optical flow

---

$H(x, y)$

$I(x, y)$

How to estimate pixel motion from image H to image I?

- Solve pixel correspondence problem
  - given a pixel in H, look for **nearby** pixels of the **same color** in I

Key assumptions

- **color constancy**: a point in H looks the same in I
  - For grayscale images, this is **brightness constancy**
- **small motion**: points do not move very far

This is called the **optical flow** problem

# Optical flow constraints (grayscale images)

---

Let's look at these constraints more closely

- brightness constancy: Q: what's the equation?

$$H(x, y) = I(x+u, y+v)$$

- small motion: (u and v are less than 1 pixel)
  - suppose we take the Taylor series expansion of I:

$$\begin{aligned} I(x+u, y+v) &= I(x, y) + \frac{\partial I}{\partial x}u + \frac{\partial I}{\partial y}v + \text{higher order terms} \\ &\approx I(x, y) + \frac{\partial I}{\partial x}u + \frac{\partial I}{\partial y}v \end{aligned}$$

# Optical flow equation

---

Combining these two equations

$$\begin{aligned}0 &= I(x + u, y + v) - H(x, y) \\ &\approx I(x, y) + I_x u + I_y v - H(x, y) \\ &\approx (I(x, y) - H(x, y)) + I_x u + I_y v \\ &\approx I_t + I_x u + I_y v \\ &\approx I_t + \nabla I \cdot [u \ v]\end{aligned}$$

shorthand:  $I_x = \frac{\partial I}{\partial x}$

The x-component of  
the gradient vector.

What is  $I_t$  ? The time derivative of the image at (x,y)

How do we calculate it?

# Optical flow equation

---

$$0 = I_t + \nabla I \cdot [u \ v]$$

Q: how many unknowns and equations per pixel?

1 equation, but 2 unknowns (u and v)

Intuitively, what does this constraint mean?

- The component of the flow in the gradient direction is determined
- The component of the flow parallel to an edge is unknown

# Lukas-Kanade flow

---

How to get more equations for a pixel?

- Basic idea: impose additional constraints
  - most common is to assume that the flow field is smooth locally
  - one method: pretend the pixel's neighbors have the same (u,v)
    - » If we use a 5x5 window, that gives us 25 equations per pixel!

$$0 = I_t(\mathbf{p}_i) + \nabla I(\mathbf{p}_i) \cdot [u \ v]$$

$$\begin{array}{c} \left[ \begin{array}{cc} I_x(\mathbf{p}_1) & I_y(\mathbf{p}_1) \\ I_x(\mathbf{p}_2) & I_y(\mathbf{p}_2) \\ \vdots & \vdots \\ I_x(\mathbf{p}_{25}) & I_y(\mathbf{p}_{25}) \end{array} \right] \begin{array}{c} \left[ \begin{array}{c} u \\ v \end{array} \right] \\ \\ \\ \end{array} = - \begin{array}{c} \left[ \begin{array}{c} I_t(\mathbf{p}_1) \\ I_t(\mathbf{p}_2) \\ \vdots \\ I_t(\mathbf{p}_{25}) \end{array} \right] \end{array} \\ \\ \begin{array}{ccc} \mathbf{A} & \mathbf{d} & \mathbf{b} \\ 25 \times 2 & 2 \times 1 & 25 \times 1 \end{array} \end{array}$$

# RGB version

---

How to get more equations for a pixel?

- Basic idea: impose additional constraints
  - most common is to assume that the flow field is smooth locally
  - one method: pretend the pixel's neighbors have the same (u,v)
    - » If we use a 5x5 window, that gives us 25\*3 equations per pixel!

$$0 = I_t(\mathbf{p}_i)[0, 1, 2] + \nabla I(\mathbf{p}_i)[0, 1, 2] \cdot [u \ v]$$

$$\begin{bmatrix} I_x(\mathbf{p}_1)[0] & I_y(\mathbf{p}_1)[0] \\ I_x(\mathbf{p}_1)[1] & I_y(\mathbf{p}_1)[1] \\ I_x(\mathbf{p}_1)[2] & I_y(\mathbf{p}_1)[2] \\ \vdots & \vdots \\ I_x(\mathbf{p}_{25})[0] & I_y(\mathbf{p}_{25})[0] \\ I_x(\mathbf{p}_{25})[1] & I_y(\mathbf{p}_{25})[1] \\ I_x(\mathbf{p}_{25})[2] & I_y(\mathbf{p}_{25})[2] \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} I_t(\mathbf{p}_1)[0] \\ I_t(\mathbf{p}_1)[1] \\ I_t(\mathbf{p}_1)[2] \\ \vdots \\ I_t(\mathbf{p}_{25})[0] \\ I_t(\mathbf{p}_{25})[1] \\ I_t(\mathbf{p}_{25})[2] \end{bmatrix}$$

$A$   
75x2

$d$   
2x1

$b$   
75x1

# Lukas-Kanade flow

---

Prob: we have more equations than unknowns

$$\begin{array}{ccc} A & d = b & \longrightarrow \text{minimize } \|Ad - b\|^2 \\ 25 \times 2 & 2 \times 1 & 25 \times 1 \end{array}$$

Solution: solve least squares problem

- minimum least squares solution given by solution (in  $d$ ) of:

$$\begin{array}{ccc} (A^T A) & d = & A^T b \\ 2 \times 2 & 2 \times 1 & 2 \times 1 \end{array}$$

$$\begin{array}{ccc} \left[ \begin{array}{cc} \sum I_x I_x & \sum I_x I_y \\ \sum I_x I_y & \sum I_y I_y \end{array} \right] & \left[ \begin{array}{c} u \\ v \end{array} \right] & = - \left[ \begin{array}{c} \sum I_x I_t \\ \sum I_y I_t \end{array} \right] \\ A^T A & & A^T b \end{array}$$

- The summations are over all pixels in the  $K \times K$  window
- This technique was first proposed by Lukas & Kanade for stereo matching (1981)

# Conditions for solvability

---

- Optimal  $(u, v)$  satisfies Lucas-Kanade equation

$$\begin{bmatrix} \sum I_x I_x & \sum I_x I_y \\ \sum I_x I_y & \sum I_y I_y \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = - \begin{bmatrix} \sum I_x I_t \\ \sum I_y I_t \end{bmatrix}$$

$A^T A$   $A^T b$

## When is This Solvable?

- $A^T A$  should be invertible
- $A^T A$  should not be too small due to noise
  - eigenvalues  $\lambda_1$  and  $\lambda_2$  of  $A^T A$  should not be too small
- $A^T A$  should be well-conditioned
  - $\lambda_1 / \lambda_2$  should not be too large ( $\lambda_1 =$  larger eigenvalue)

# Edges cause problems

$$\sum \nabla I (\nabla I)^T$$

- large gradients, all the same
- large  $\lambda_1$ , small  $\lambda_2$

# Low texture regions don't work

$$\sum \nabla I (\nabla I)^T$$

- gradients have small magnitude
- small  $\lambda_1$ , small  $\lambda_2$

# High textured region work best

$$\sum \nabla I (\nabla I)^T$$

- gradients are different, large magnitudes
- large  $\lambda_1$ , large  $\lambda_2$

# Errors in Lukas-Kanade

---

What are the potential causes of errors in this procedure?

- Suppose  $A^T A$  is easily invertible
- Suppose there is not much noise in the image

When our assumptions are violated

- Brightness constancy is **not** satisfied
- The motion is **not** small
- A point does **not** move like its neighbors
  - window size is too large
  - what is the ideal window size?

# Revisiting the small motion assumption

---

Is this motion small enough?

- Probably not—it's much larger than one pixel (2<sup>nd</sup> order terms dominate)
- How might we solve this problem?

# Reduce the resolution!

---

# Coarse-to-fine optical flow estimation

---

**Gaussian pyramid of image H**

*$u=1.25$  pixels*

*$u=2.5$  pixels*

*$u=5$  pixels*

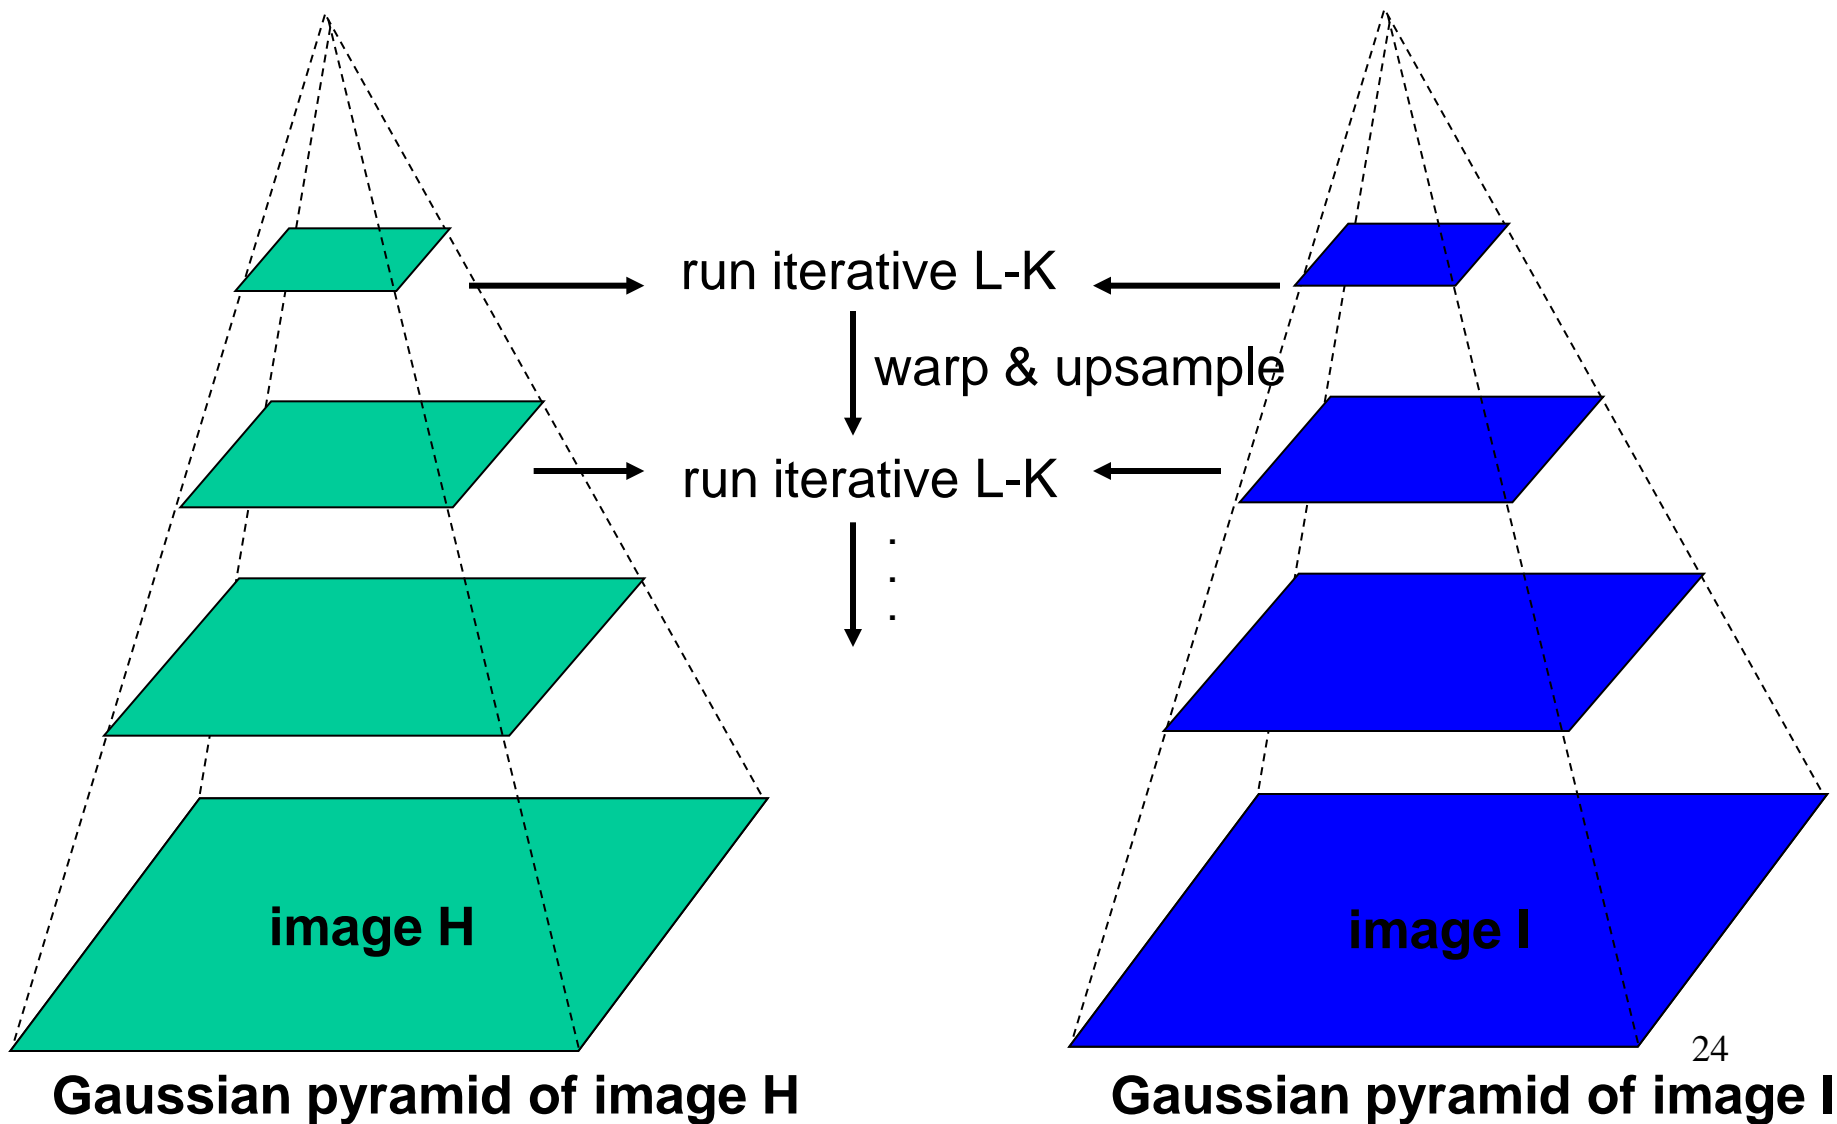

*$u=10$  pixels*

**Gaussian pyramid of image I**

# Coarse-to-fine optical flow estimation

---

# A Few Details

---

- **Top Level**
  - Apply L-K to get a flow field representing the flow from the first frame to the second frame.
  - Apply this flow field to warp the first frame toward the second frame.
  - Rerun L-K on the new warped image to get a flow field from it to the second frame.
  - Repeat till convergence.
- **Next Level**
  - Upsample the flow field to the next level as the first guess of the flow at that level.
  - Apply this flow field to warp the first frame toward the second frame.
  - Rerun L-K and warping till convergence as above.
- **Etc.**

# Estimating Piecewise-Smooth Optical Flow with Global Matching and Graduated Optimization

## *Problem Statement:*

*Assuming only **brightness conservation** and **piecewise-smooth motion**, find the optical flow to best describe the intensity change in three frames.*

# Approach: Matching-Based Global Optimization

---

- **Step 1. Robust local gradient-based method for high-quality initial flow estimate.**
- **Step 2. Global gradient-based method to improve the flow-field coherence.**
- **Step 3. Global matching that minimizes energy by a greedy approach.**

# Global Energy Design

---

## Global energy

$$E = \sum_{\text{all sites } s} E_B(V_s) + E_S(V_s)$$

- $V$  is the optical flow field.
- $V_s$  is the optical flow at pixel (site)  $s$ .
- $E_B$  is the brightness conservation error.
- $E_S$  is the flow smoothness error in a neighborhood about pixel  $s$ .

# Global Energy Design

---

Brightness error

$$E_B(V_s) = \rho(e_W(V_s), \sigma_{B_s})$$

warping error

$$e_W(V_s) = \min(|I^-(V_s) - I_s|, |I^+(V_s) - I_s|)$$

$I^-(V_s)$  is the warped intensity in the previous frame.

$I^+(V_s)$  is the warped intensity in the next frame.

**Error function:**  $\rho(x, \sigma) = \frac{x^2}{\sigma^2 + x^2}$  where  $\sigma$  is a scale parameter. 34

# Global Energy Design

---

Smoothness error

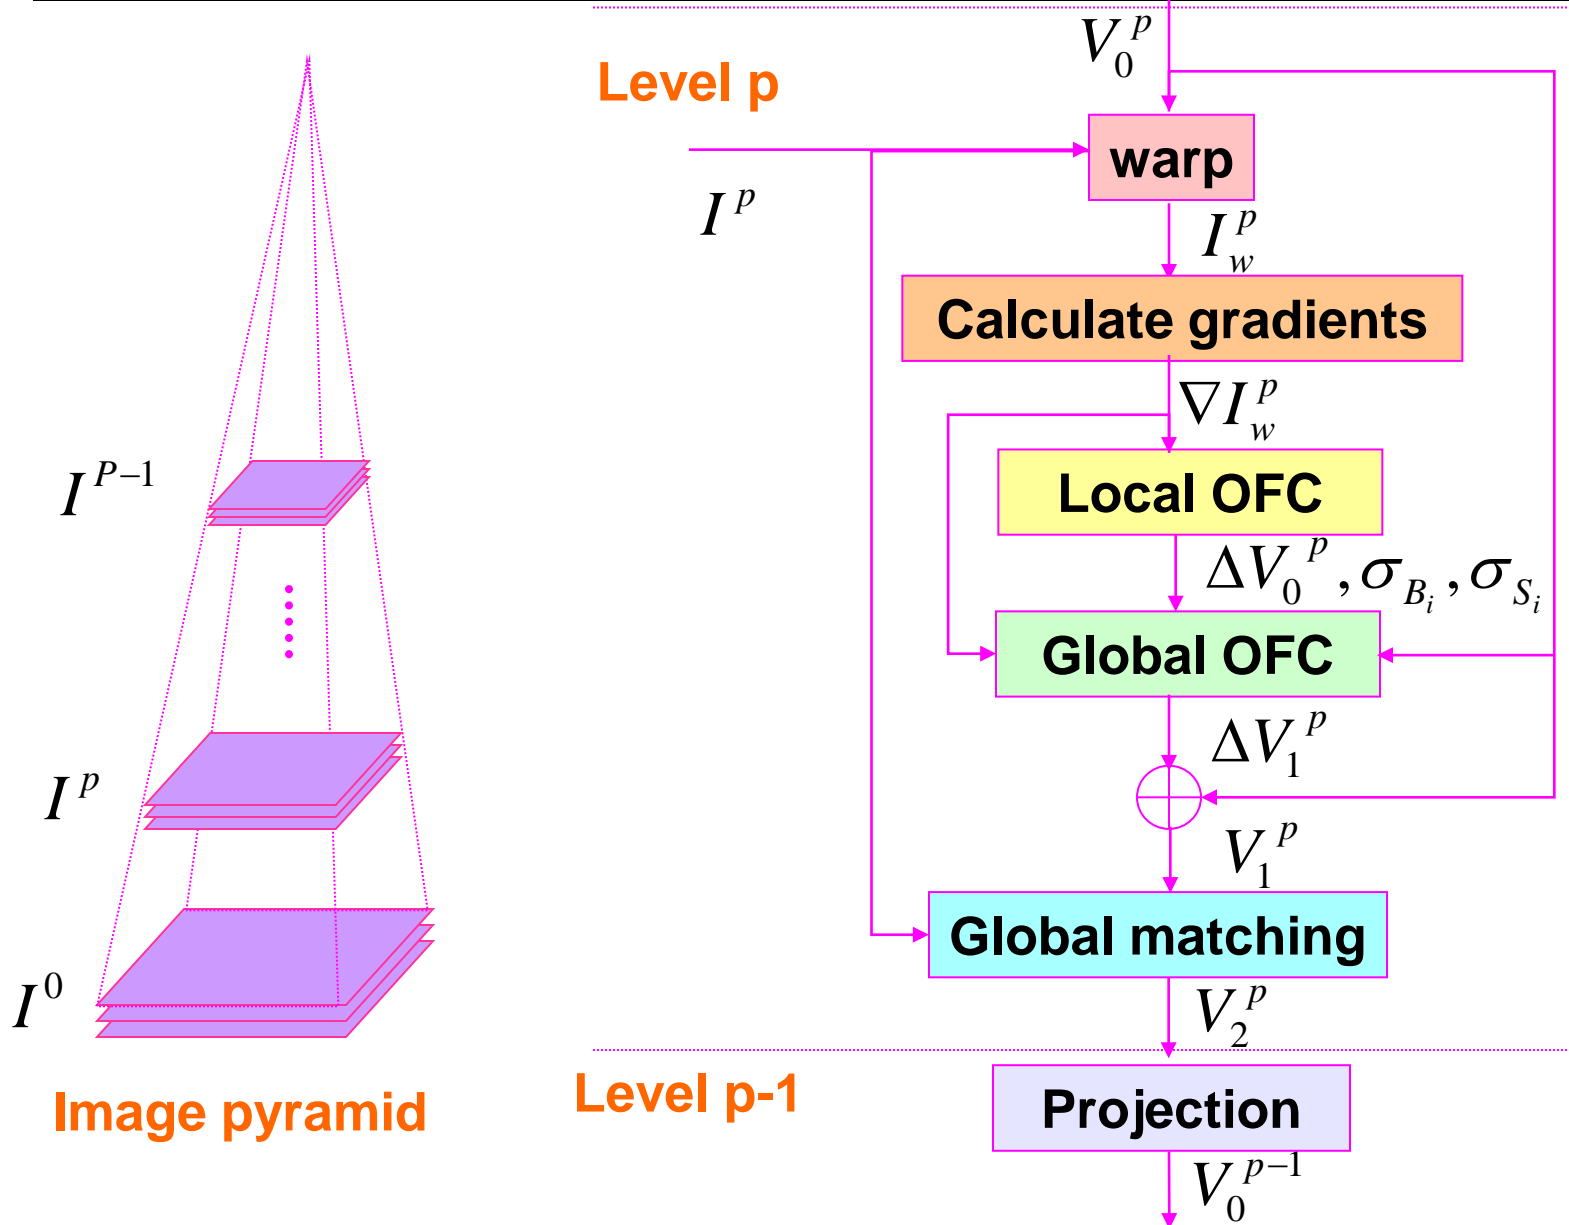

$$E_S(V_i) = \frac{1}{8} \sum_{n \in N_s^8} \rho(|V_s - V_n|, \sigma_{S_s})$$

Smoothness error is computed in a neighborhood around pixel  $s$ .

**Error function:**  $\rho(x, \sigma) = \frac{x^2}{\sigma^2 + x^2}$

# Overall Algorithm

# Advantages

---

## Best of Everything

- Local OFC
  - High-quality initial flow estimates
  - Robust local scale estimates
- Global OFC
  - Improve flow smoothness
- Global Matching
  - The optimal formulation
  - Correct errors caused by poor gradient quality and hierarchical process

Results: fast convergence, high accuracy, simultaneous motion boundary detection

# Experiments

---

- **Experiments were run on several standard test videos.**
- **Estimates of optical flow were made for the middle frame of every three.**
- **The results were compared with the Black and Anandan algorithm.**
