# CSE 455 Object Recognition

Linda Shapiro Professor of Computer Science & Engineering Professor of Electrical Engineering

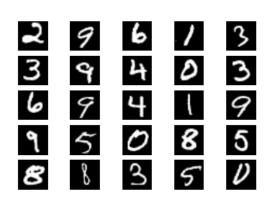

With slides from Ross Girshick

# Outline

- Object detection
  - the task, evaluation, datasets
- Convolutional Neural Networks (CNNs)
  - overview and history
- Region-based Convolutional Networks (R-CNNs)
- You Only Look Once (YOLO)

# Image classification

- K classes
- Task: assign correct class label to the whole image

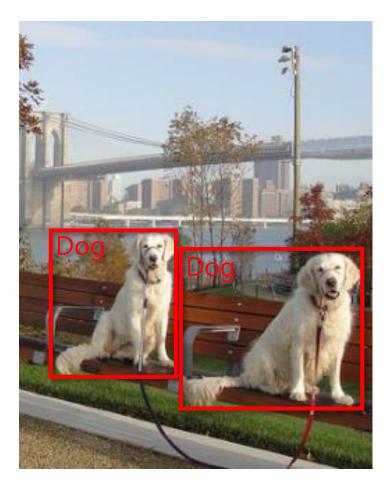

Digit classification (MNIST)

Object recognition (Caltech-101)

### Classification vs. Detection

# Problem formulation

#### { airplane, bird, motorbike, person, sofa }

motorbike

person

#### Input

#### **Desired** output

#### Evaluating a detector

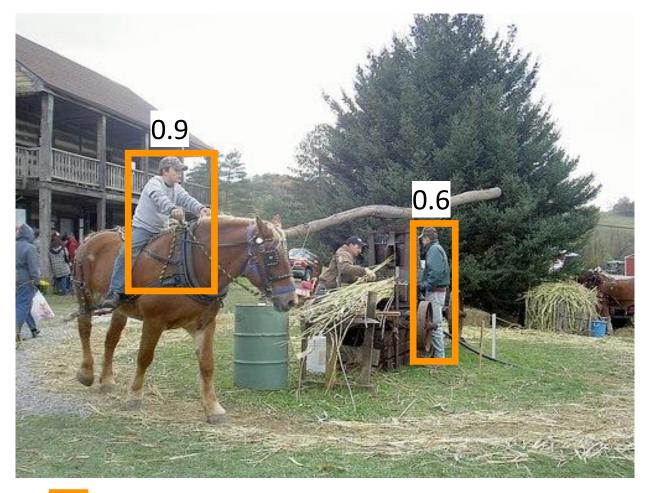

#### Test image (previously unseen)

#### First detection ...

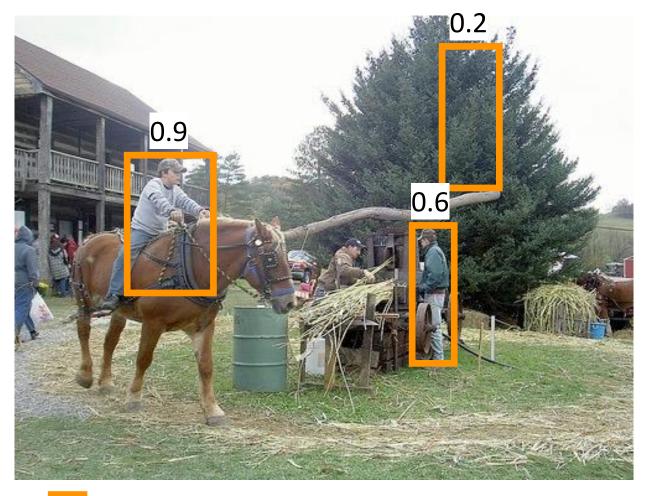

'person' detector predictions

#### Second detection ...

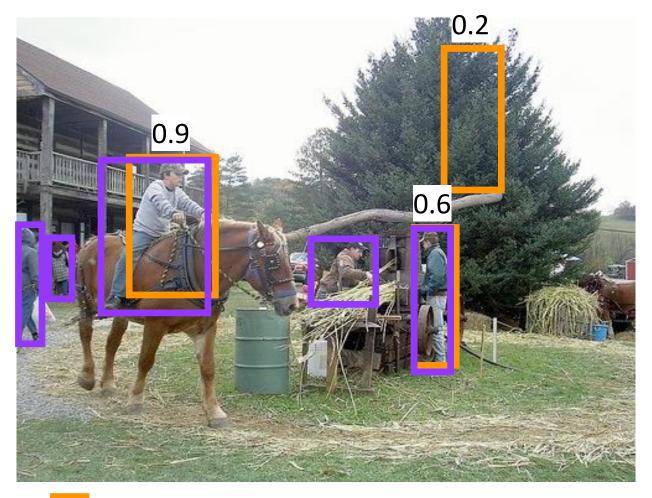

'person' detector predictions

#### Third detection ...

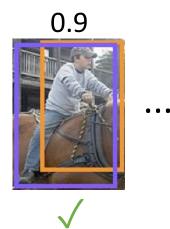

'person' detector predictions

#### Compare to ground truth

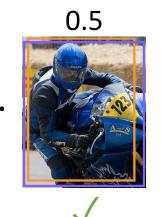

'person' detector predictions
ground truth 'person' boxes

### Sort by confidence

0.1

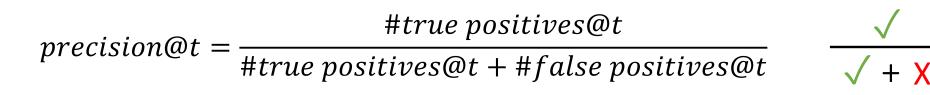

Х

#### true positive (high overlap)

false positive (no overlap, low overlap, or duplicate)

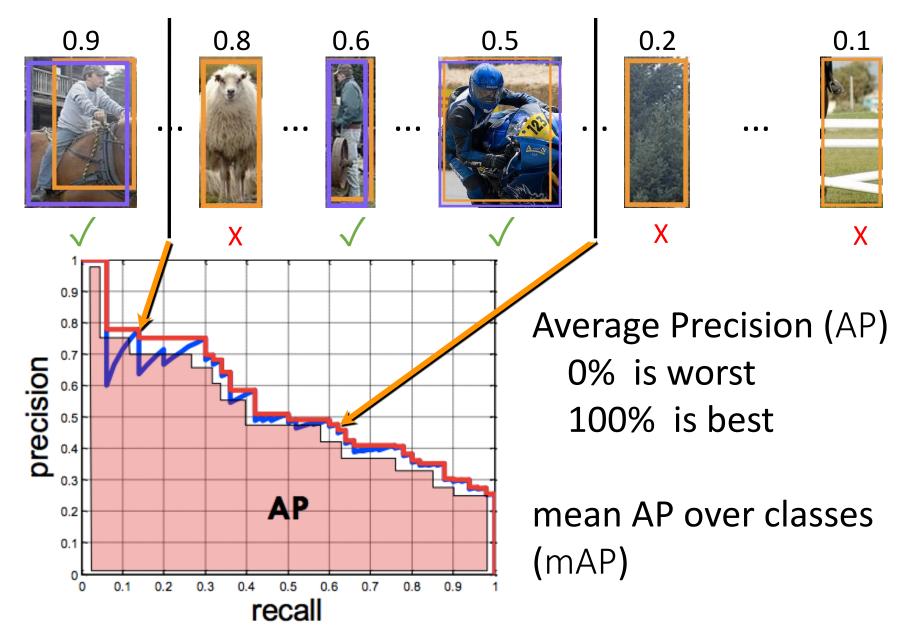

#### **Evaluation metric**

 $recall@t = \frac{\#true\ positives@t}{\#ground\ truth\ objects}$ 

#### **Evaluation metric**

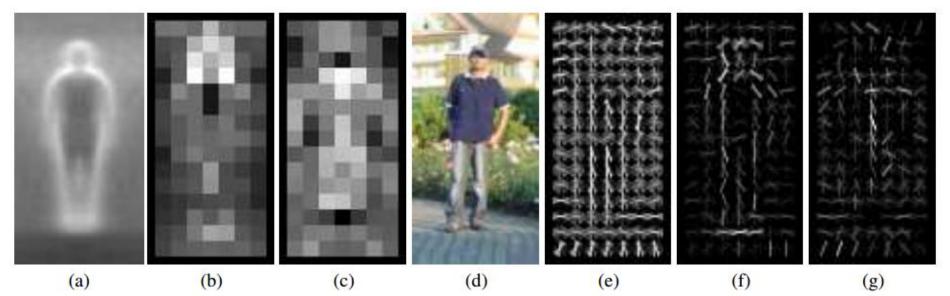

# Pedestrians

**Histograms of Oriented Gradients for Human Detection**, Dalal and Triggs, CVPR 2005

#### AP ~77%

More sophisticated methods: AP ~90%

- (a) average gradient image over training examples
- (b) each "pixel" shows max positive SVM weight in the block centered on that pixel
- (c) same as (b) for negative SVM weights
- (d) test image
- (e) its R-HOG descriptor
- (f) R-HOG descriptor weighted by positive SVM weights
- (g) R-HOG descriptor weighted by negative SVM weights

### Overview of HOG Method

- 1. Compute gradients in the region to be described
- 2. Put them in bins according to orientation
- 3. Group the cells into large blocks
- 4. Normalize each block
- 5. Train classifiers to decide if these are parts of a human

# Details

#### Gradients

 $[-1 \ 0 \ 1]$  and  $[-1 \ 0 \ 1]^{\mathsf{T}}$  were good enough filters.

#### Cell Histograms

Each pixel within the cell casts a weighted vote for an orientation-based histogram channel based on the values found in the gradient computation. (9 channels worked)

#### Blocks

Group the cells together into larger blocks, either R-HOG blocks (rectangular) or C-HOG blocks (circular).

# More Details

Block Normalization

They tried 4 different kinds of normalization.

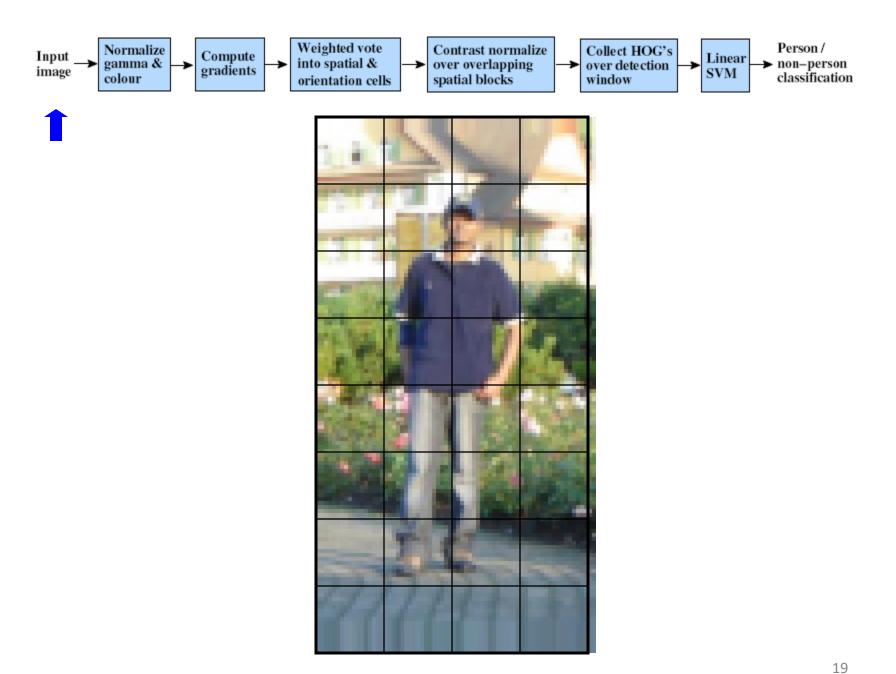

- L1-norm
- sqrt of L1-norm
- L2 norm
- L2-norm followed by clipping

 If you think of the block as a vector v, then the normalized block is v/norm(v)

# Example: Dalal-Triggs pedestrian

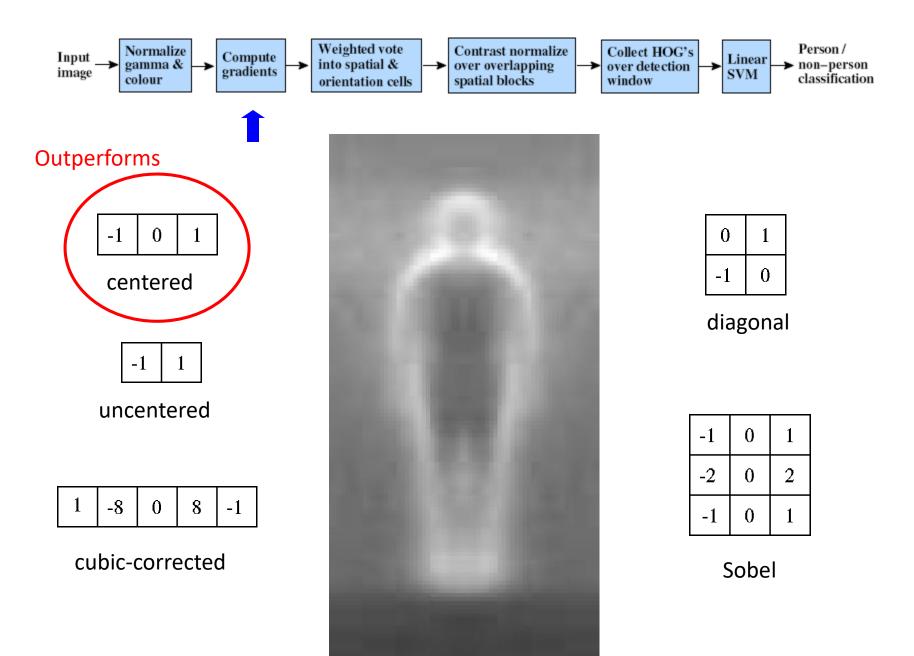

- 1. Extract fixed-sized (64x128 pixel) window at each position and scale
- 2. Compute HOG (histogram of gradient) features within each window
- 3. Score the window with a linear SVM classifier
- 4. Perform non-maxima suppression to remove overlapping detections with lower scores

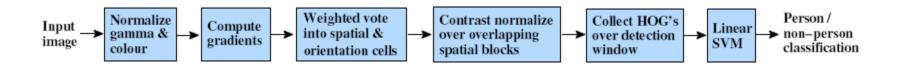

Slides by Pete Barnum

Navneet Dalal and Bill Triggs, Histograms of Oriented Gradients for Human Detection, CVPR05

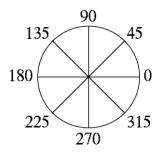

Navneet Dalal and Bill Triggs, Histograms of Oriented Gradients for Human Detection, CVPR05

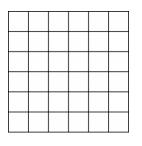

• Histogram of gradient orientations

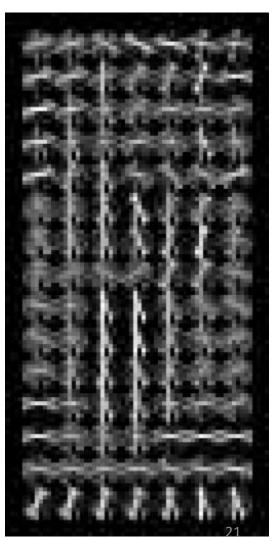

Orientation: 9 bins (for unsigned angles)

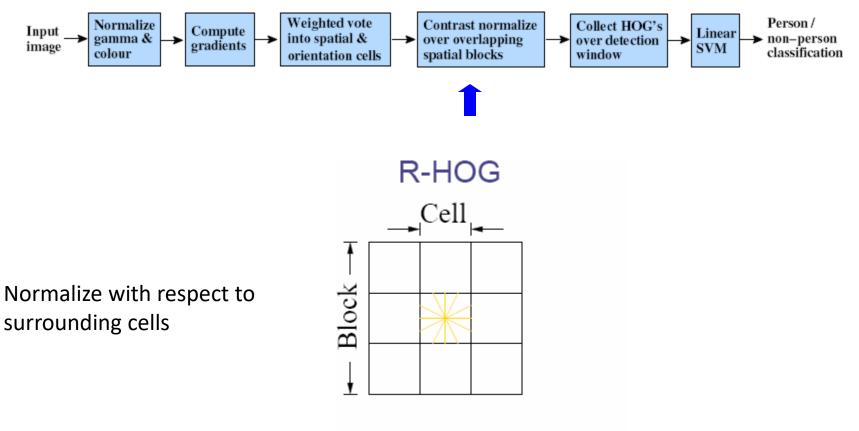

Histograms in 8x8 pixel cells

- Votes weighted by magnitude
- Bilinear interpolation between cells

$$L2 - norm : v \longrightarrow v/\sqrt{||v||_2^2 + \epsilon^2}$$

#### Detection examples

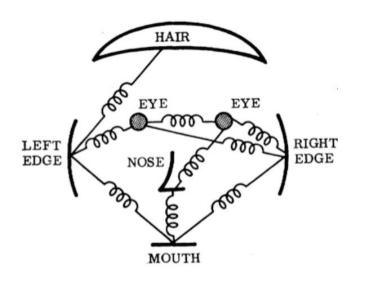

# Deformable Parts Model

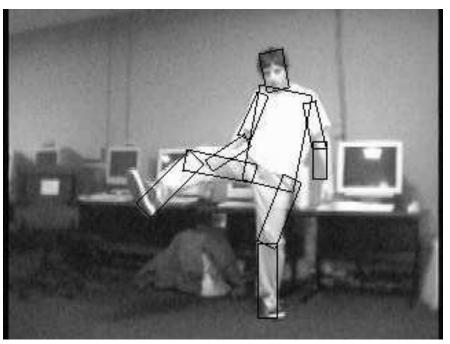

- Takes the idea a little further
- Instead of one rigid HOG model, we have multiple HOG models in a spatial arrangement
- One root part to find first and multiple other parts in a tree structure.

# The Idea

Articulated parts model

- Object is configuration of parts
- Each part is detectable

# Deformable objects

Images from Caltech-256

<sup>33</sup> Slide Credit: Duan Tran

## Deformable objects

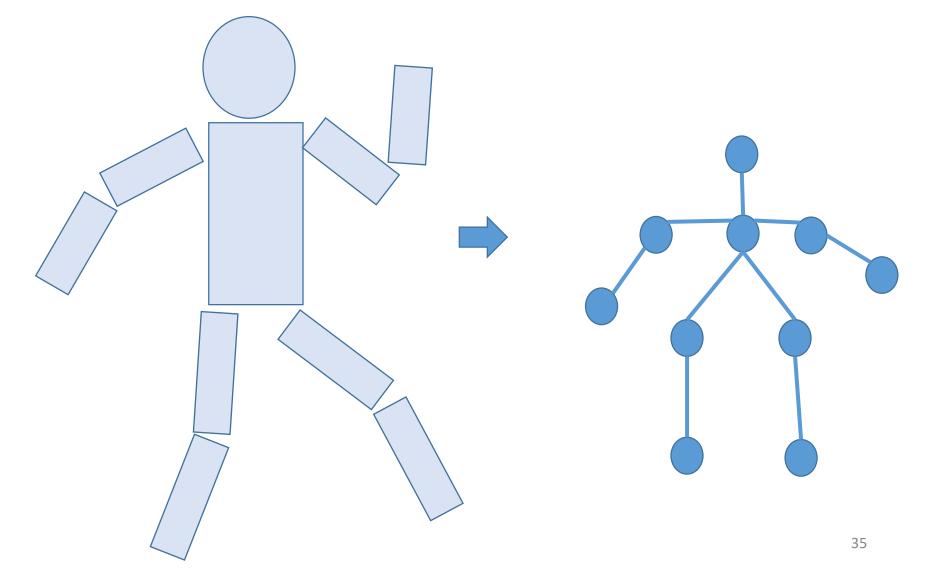

#### Images from D. Ramanan's dataset

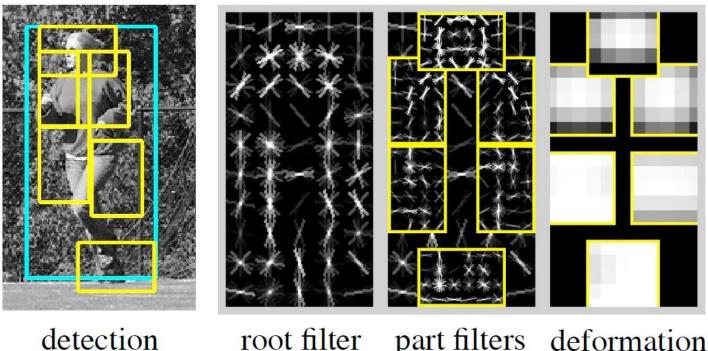

# How to model spatial relations?

• Tree-shaped model

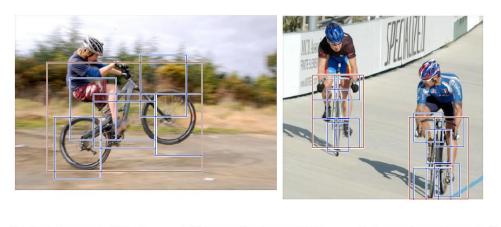

#### Model Overview

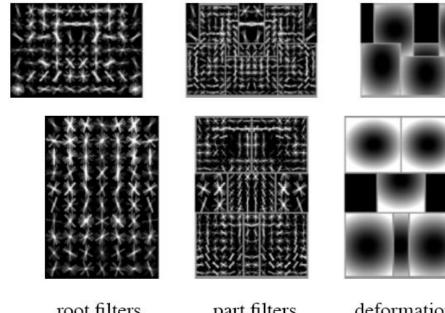

tion root filter part filters deformation models

Model has a root filter plus deformable parts

### Hybrid template/parts model

Detections

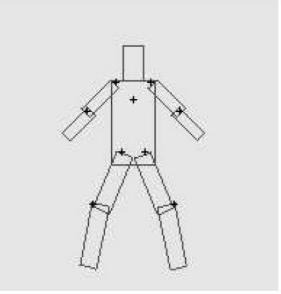

Template Visualization

root filters coarse resolution

part filters finer resolution

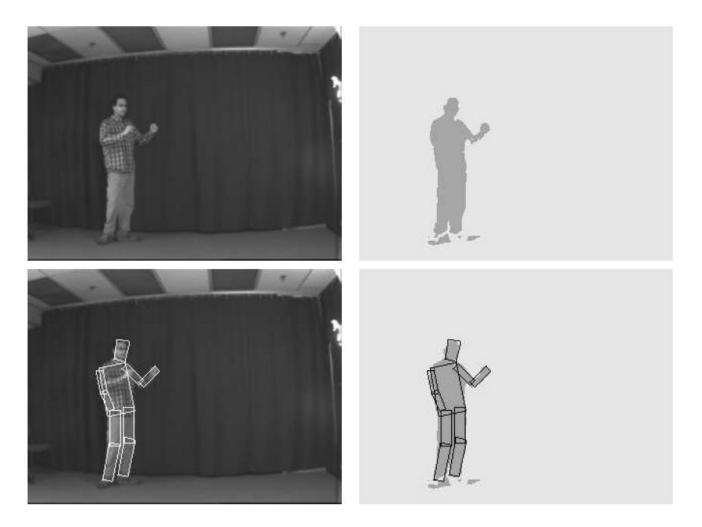

deformation models

### Pictorial Structures Model

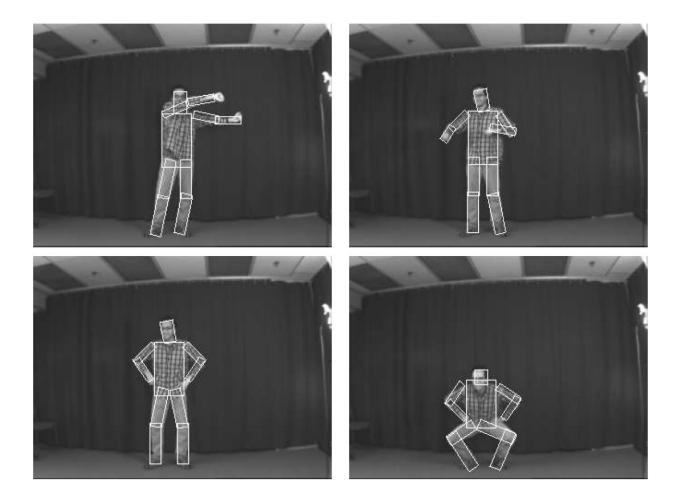

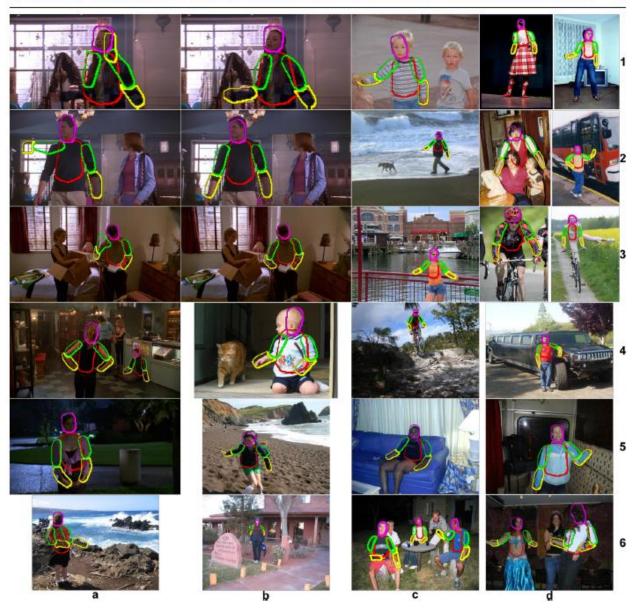

$$P(L|I, \theta) \propto \left(\prod_{i=1}^{n} p(I|l_i, u_i) \prod_{(v_i, v_j) \in E} p(l_i, l_j | c_{ij})\right)$$
  
Appearance likelihood Geometry likelihood

# Results for person matching

## Results for person matching

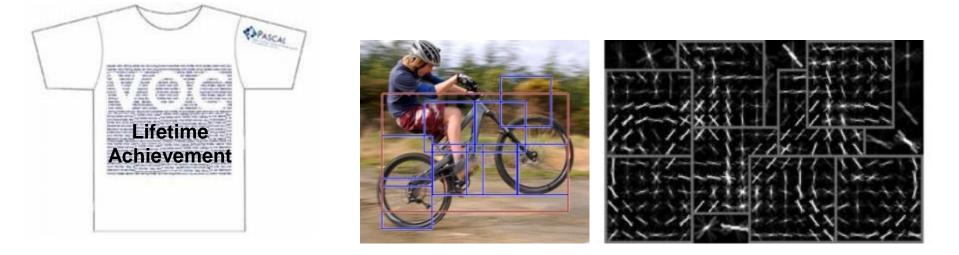

EICHNER, FERRARI: BETTER APPEARANCE MODELS FOR PICTORIAL STRUCTURES 9

# 2012 State-of-the-art Detector: Deformable Parts Model (DPM)

- 1. Strong low-level features based on HOG
- 2. Efficient matching algorithms for deformable part-based models (pictorial structures)
- 3. Discriminative learning with latent variables (latent SVM)

Felzenszwalb et al., 2008, 2010, 2011, 2012

#### Why did gradient-based models work?

#### Generic categories

Can we detect people, chairs, horses, cars, dogs, buses, bottles, sheep ...? PASCAL Visual Object Categories (VOC) dataset

#### Generic categories Why doesn't this work (as well)?

Can we detect people, chairs, horses, cars, dogs, buses, bottles, sheep ...? PASCAL Visual Object Categories (VOC) dataset Quiz time (Back to Girshick)

# Warm up

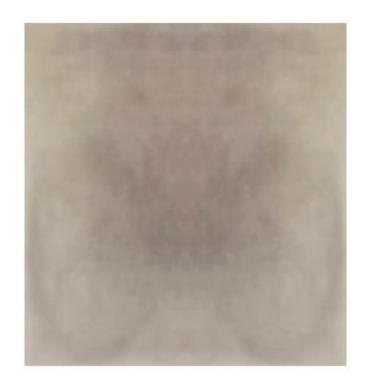

#### This is an average image of which object class?

# Warm up

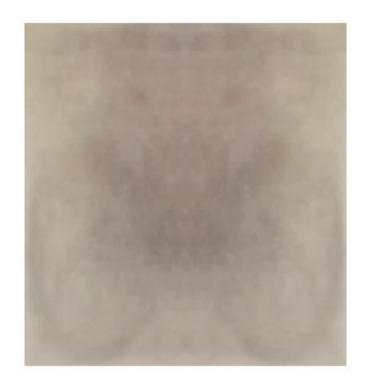

#### pedestrian

# A little harder

?

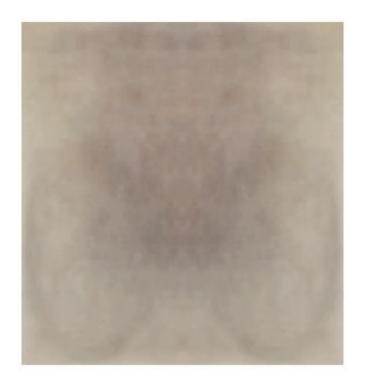

# A little harder

?

Hint: airplane, bicycle, bus, car, cat, chair, cow, dog, dining table

# A little harder

bicycle (PASCAL)

### Region-based Convolutional Networks (R-CNNs)

[R-CNN. Girshick et al. CVPR 2014]

### Region-based Convolutional Networks (R-CNNs)

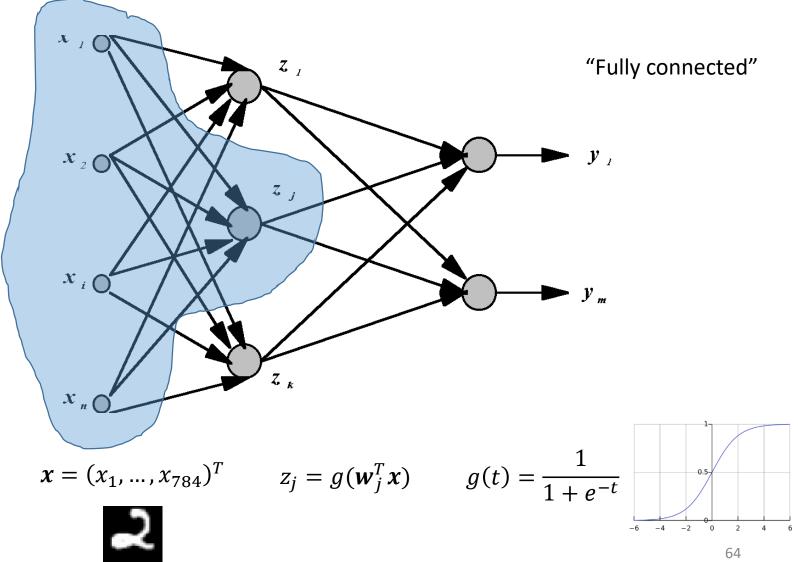

[R-CNN. Girshick et al. CVPR 2014]

# **Convolutional Neural Networks**

• Overview

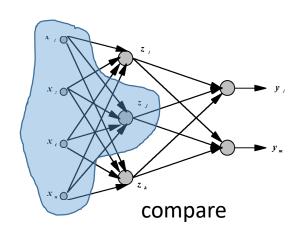

## Standard Neural Networks

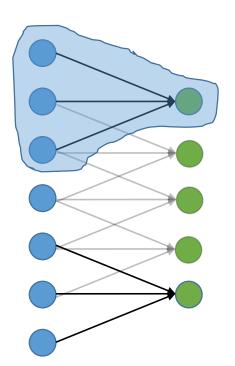

# From NNs to Convolutional NNs

- Local connectivity
- Shared ("tied") weights
- Multiple feature maps
- Pooling

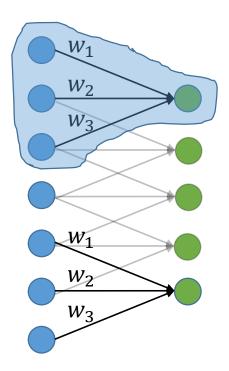

Local connectivity

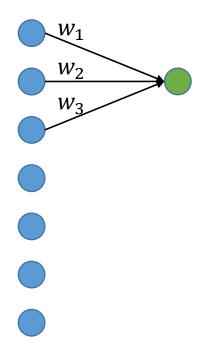

Each green unit is only connected to (3)
 neighboring blue units

• Shared ("tied") weights

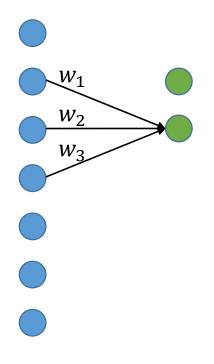

- All green units **share** the same parameters **w**
- Each green unit computes the same function, but with a different input window

• Convolution with 1-D filter:  $[w_3, w_2, w_1]$ 

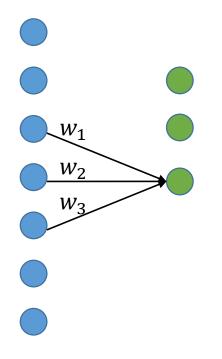

- All green units **share** the same parameters **w**
- Each green unit computes the **same function**, but with a **different input window**

• Convolution with 1-D filter:  $[w_3, w_2, w_1]$ 

- All green units **share** the same parameters **w**
- Each green unit computes the **same function**, but with a **different input window**

• Convolution with 1-D filter:  $[w_3, w_2, w_1]$ 

- All green units **share** the same parameters **w**
- Each green unit computes the **same function**, but with a **different input window**

 $W_1$ 

 $W_2$ 

Wz

• Convolution with 1-D filter:  $[w_3, w_2, w_1]$ 

• Each green unit computes the **same function**, but with a **different input window** 

 $W_1$ 

 $W_2$ 

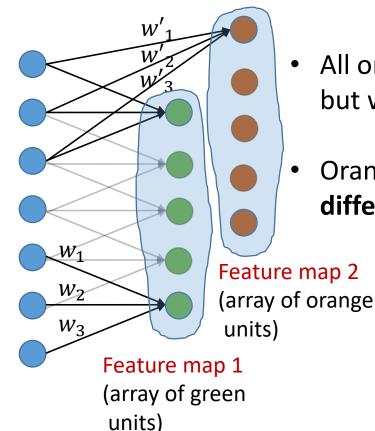

Wz

• Convolution with 1-D filter:  $[w_3, w_2, w_1]$ 

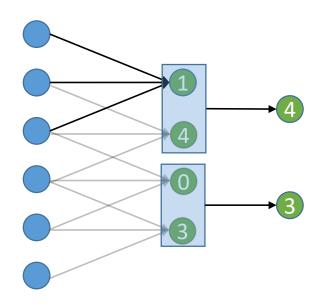

• Each green unit computes the **same function**, but with a **different input window** 

• Multiple feature maps

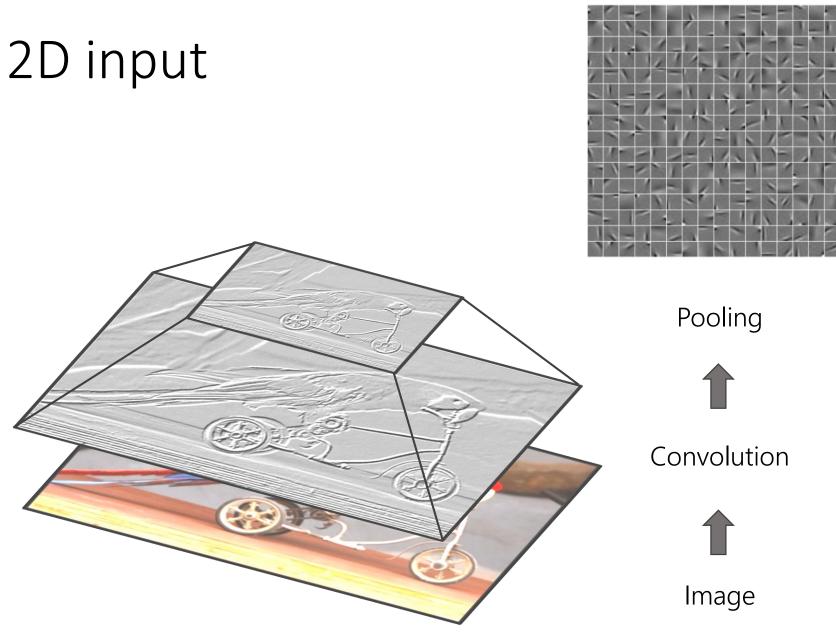

- All orange units compute the same function but with a different input windows
  - Orange and green units **compute different functions**

• Pooling (max, average)

- Pooling area (how much to pool): 2 units
- Pooling stride (how far to move): 2 units
- Subsamples feature maps

## Historical perspective – 1980

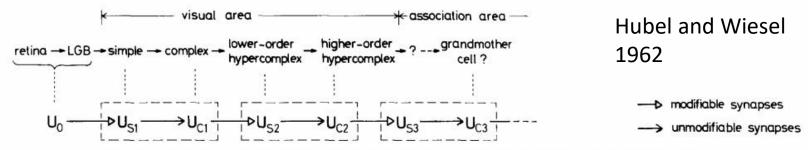

Fig. 1. Correspondence between the hierarchy model by Hubel and Wiesel, and the neural network of the neocognitron

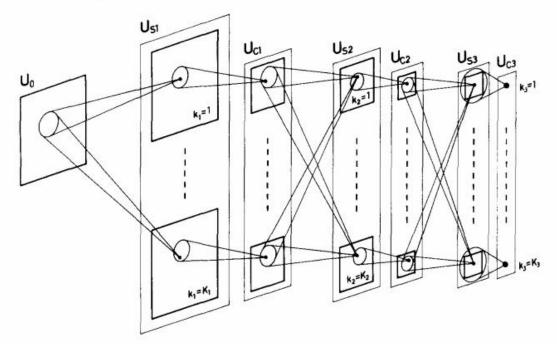

Fig. 2. Schematic diagram illustrating the interconnections between layers in the neocognitron

Included basic ingredients of ConvNets, but no supervised learning algorithm

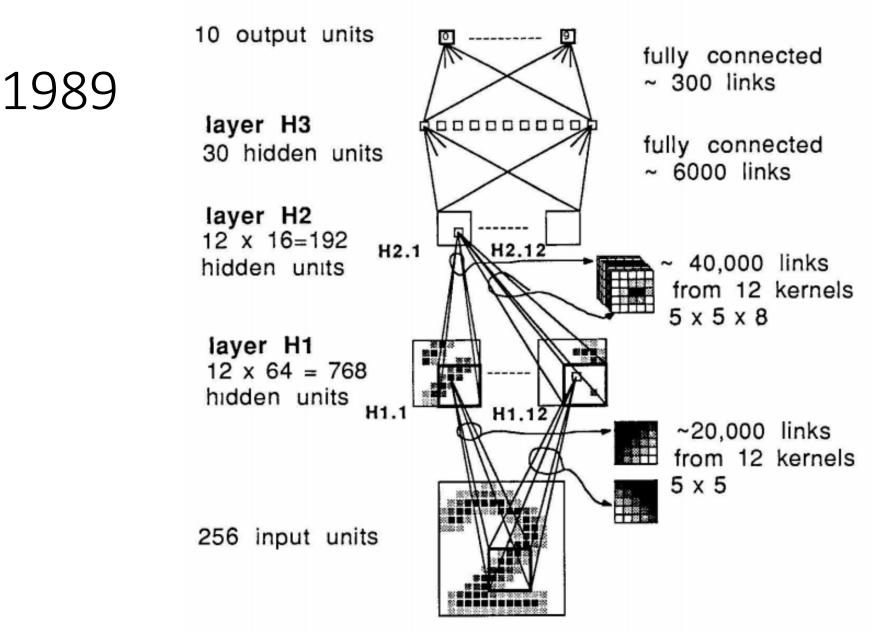

## Supervised learning – 1986

Gradient descent training with error backpropagation

Learning Internal Representations by Error Propagation

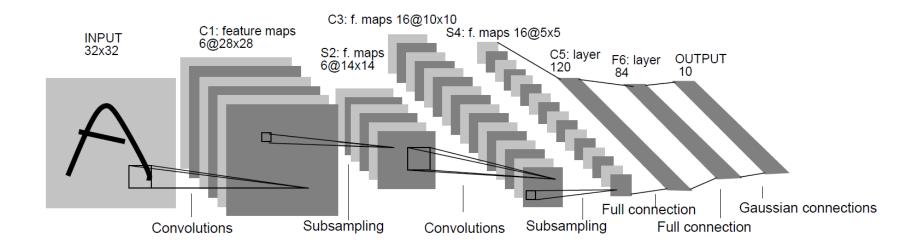

D. E. RUMELHART, G. E. HINTON, and R. J. WILLIAMS

Early demonstration that error backpropagation can be used for supervised training of neural nets (including ConvNets)

**Backpropagation applied to handwritten zip code recognition**, Lecun et al., 1989

## Practical ConvNets

#### Gradient-Based Learning Applied to Document Recognition,

Lecun et al., 1998

## Core idea of "deep learning"

- Input: the "raw" signal (image, waveform, ...)
- Features: hierarchy of features is *learned* from the raw input

## What's new since the 1980s?

#### More layers

- LeNet-3 and LeNet-5 had 3 and 5 learnable layers
- Current models have 8 20+
- "ReLU" non-linearities (Rectified Linear Unit)
  - $g(x) = \max(0, x)$
  - Gradient doesn't vanish
- "Dropout" regularization (randomly selects neurons to remove during training epochs, reduces overfitting)
- Fast GPU implementations
- More data

g(x)

X

### Demo

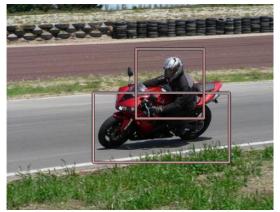

- <u>http://cs.stanford.edu/people/karpathy/convnetjs/</u> <u>demo/mnist.html</u>
- ConvNetJS by Andrej Karpathy (Ph.D. student at Stanford)

Software libraries

- Caffe (C++, python, matlab)
- Torch7 (C++, lua)
- Theano (python)

#### What else? Object Proposals

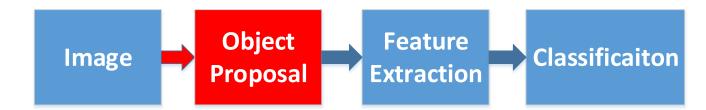

Sliding window based object detection

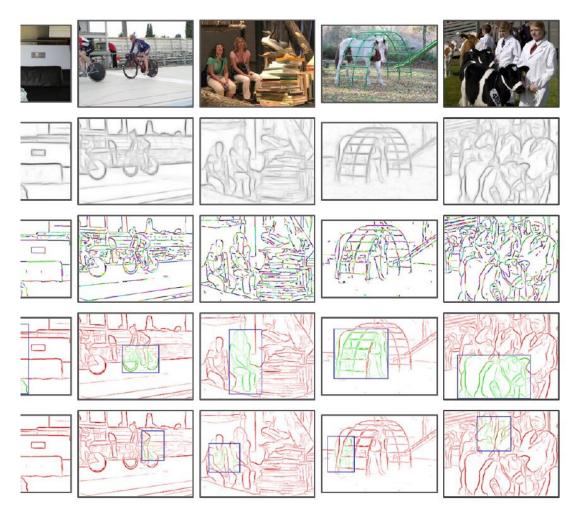

Iterate over window size, aspect ratio, and location

- Object proposals
  - Fast execution
  - High recall with low # of candidate boxes

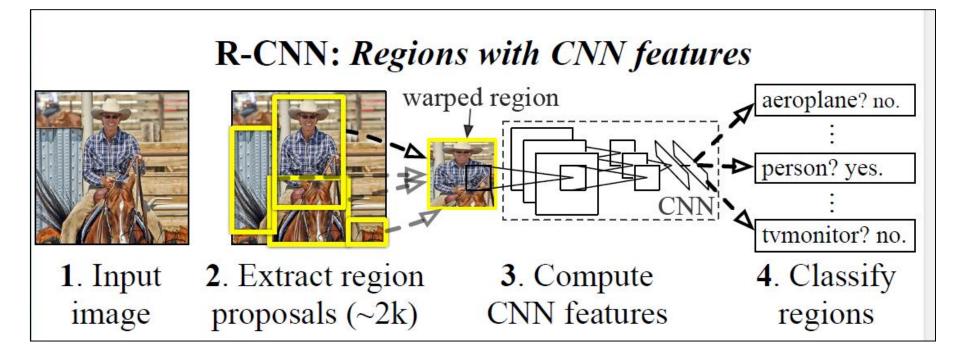

#### . Lawrence Zitnick and Piotr Dollár

The number of contours wholly enclosed by a bounding box is indicative of the likelihood of the box containing an object.

#### Ross's Own System: Region CNNs

#### **Competitive Results**

VOC 2010 test	aero	bike	bird	boat	bottle	bus	car	cat	chair	cow	table	dog	horse	mbike	person	plant	shee p	sofa	train	tv	mAP
DPM v5 [20] <sup>†</sup>	49.2	53.8	13.1	15.3	35.5	53.4	49.7	27.0	17.2	28.8	14.7	17.8	46.4	51.2	47.7	10.8	34.2	20.7	43.8	38.3	33.4

Regionlets [41]	65.0	48.9	25.9	24.6	24.5	56.1	54.5	51.2	17.0	28.9	30.2	35.8	40.2	55.7	43.5	14.3	43.9	32.6	54.0	45.9	39.7
SegDPM [18] <sup>†</sup>	61.4	53.4	25.6	25.2	35.5	51.7	50.6	50.8	19.3	33.8	26.8	40.4	48.3	54.4	47.1	14.8	38.7	35.0	52.8	43.1	40.4
R-CNN	67.1	64.1	46.7	32.0	30.5	56.4	57.2	65.9	27.0	47.3	40.9	66.6	57.8	65.9	53.6	26.7	56.5	38.1	52.8	50.2	50.2
R-CNN BB	71.8	65.8	53.0	36.8	35.9	59.7	60.0	69.9	27.9	50.6	41.4	70.0	62.0	69.0	58.1	29.5	59.4	39.3	61.2	52.4	53.7

Table 1: Detection average precision (%) on VOC 2010 test. R-CNN is most directly comparable to UVA and Regionlets since all methods use selective search region proposals. Bounding-box regression (BB) is described in Section C. At publication time, SegDPM was the top-performer on the PASCAL VOC leaderboard. <sup>†</sup>DPM and SegDPM use context rescoring not used by the other methods.

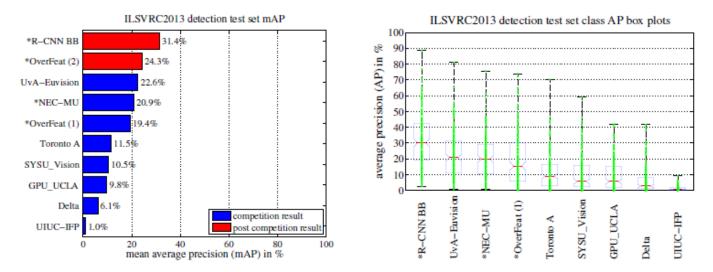

Figure 3: (Left) Mean average precision on the ILSVRC2013 detection test set. Methods preceded by \* use outside training data (images and labels from the ILSVRC classification dataset in all cases). (Right) Box plots for the 200 average precision values per method. A box plot for the post-competition OverFeat result is not shown because per-class APs are not yet available (per-class APs for R-CNN are in Table 8 and also included in the tech report source uploaded to arXiv.org; see R-CNN-ILSVRC2013-APs.txt). The red line marks the median AP, the box bottom and top are the 25th and 75th percentiles. The whiskers extend to the min and max AP of each method. Each AP is plotted as a green dot over the whiskers (best viewed digitally with zoom).

#### Top Regions for Six Object Classes

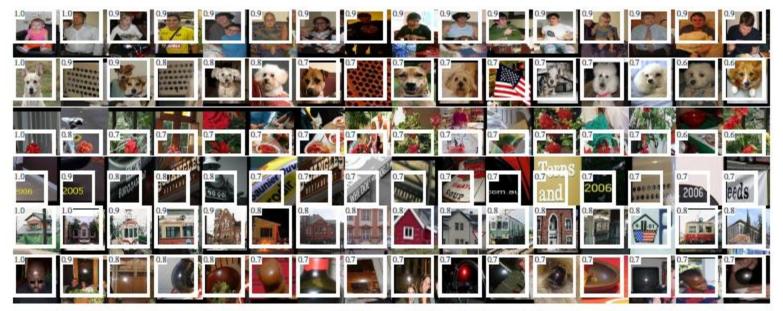

Figure 4: Top regions for six pool<sub>5</sub> units. Receptive fields and activation values are drawn in white. Some units are aligned to concepts, such as people (row 1) or text (4). Other units capture texture and material properties, such as dot arrays (2) and specular reflections (6).

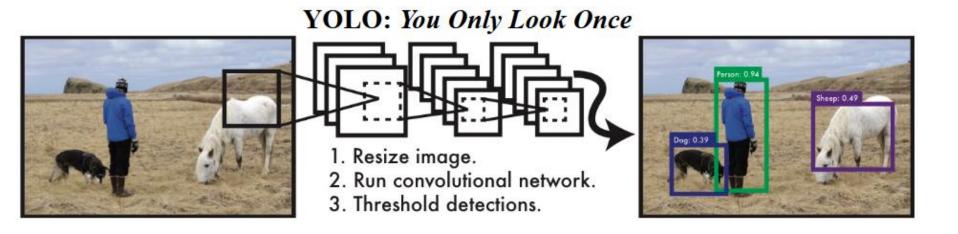

## What came Next?

- Faster R-CNN (Girshick, 2016)
- YOLO (Redmon, Girshick, Divvala, Farhadi, 2016) You Only Look Once (People's Choice Award)
- YOLO9000: Better, Faster, Stronger (Redmon, Farhadi, CVPR 2017) Runner up for Best Paper
- YOLOv3: more improvements

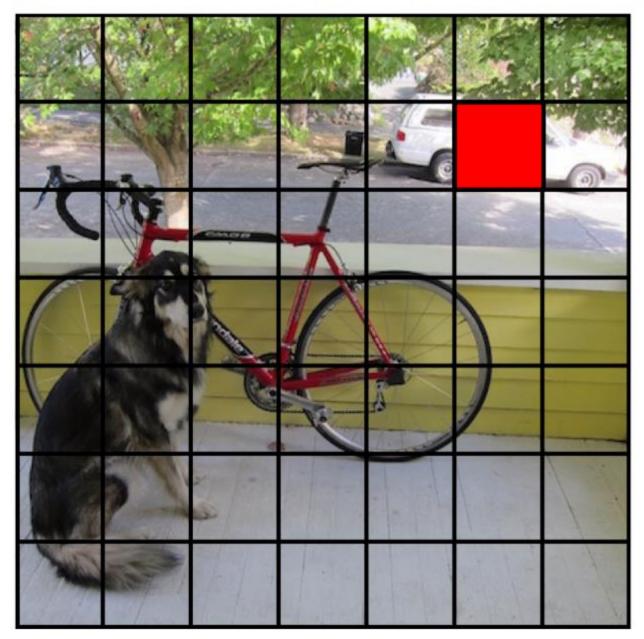

#### Accurate object detection is slow!

	Pascal 2007 mAP	Speed					
DPM v5	33.7	.07 FPS	14 s/img				
R-CNN	66.0	.05 FPS	20 s/img				
Fast R-CNN	70.0	.5 FPS	2 s/img				
Faster R-CNN	73.2	7 FPS	140 ms/img				
YOLO	69.0	45 FPS	22 ms/img				

# With YOLO, you only look once at an image to perform detection

#### Each cell predicts boxes and confidences: P(Object)

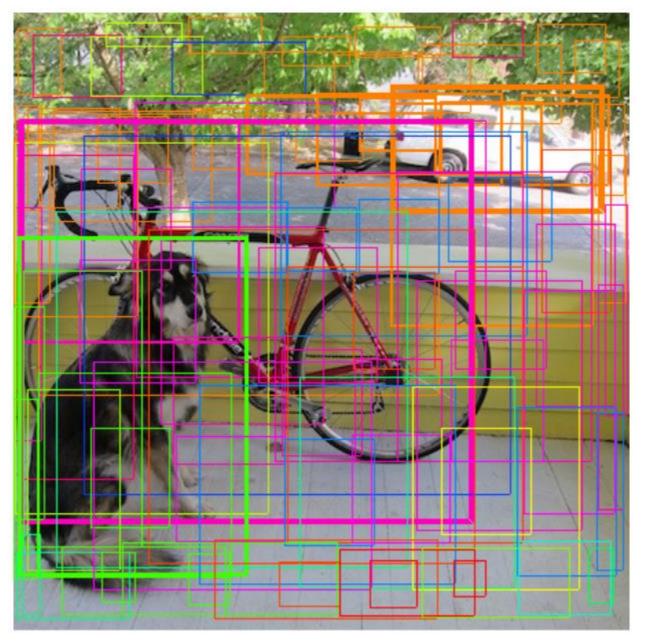

#### Each cell predicts boxes and confidences: P(Object)

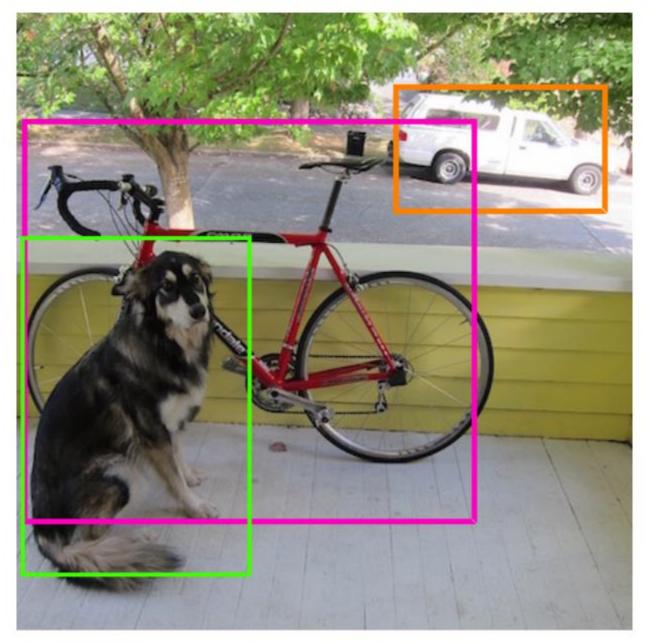

#### Each cell also predicts a class probability.

Bicycle Саг Dog Dining Table

#### Then we combine the box and class predictions.

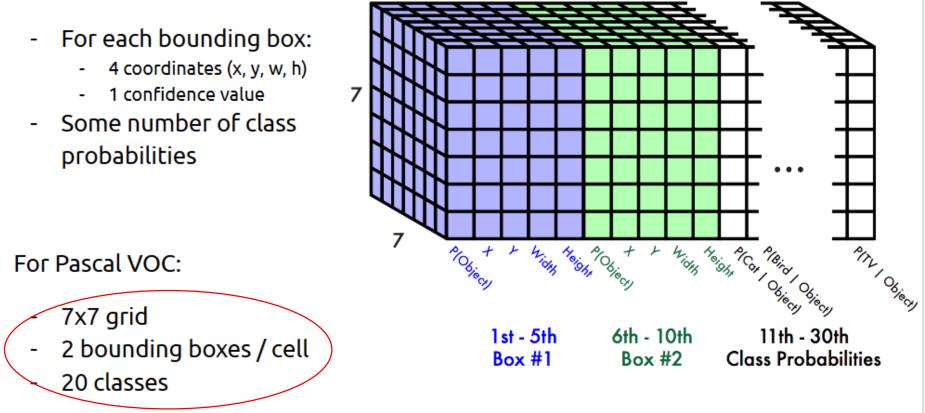

#### Finally we do NMS and threshold detections

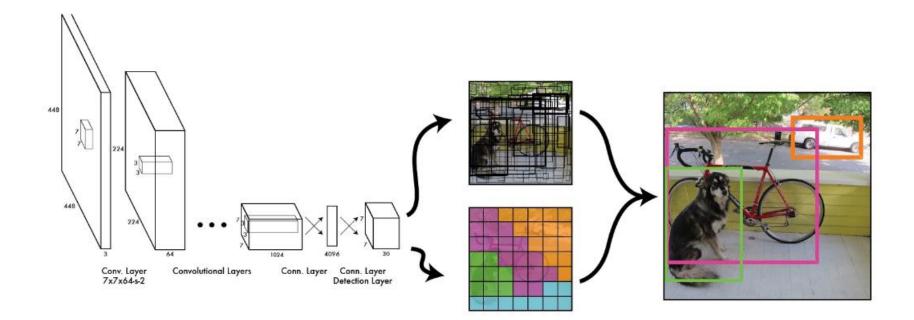

#### This parameterization fixes the output size

Each cell predicts:

7 x 7 x (2 x 5 + 20) = 7 x 7 x 30 tensor = 1470 outputs

# Thus we can train one neural network to be a whole detection pipeline

## More YOLO (second paper)

- At 67 FPS, YOLOv2 gets76.8 mAP on VOC 2007.
- At 40 FPS, YOLOv2 gets 78.6mAP, outperforming state-of-the-art methods like Faster R-CNN with ResNet and SSD while still running significantly faster
- A new methodology that jointly trains for detection and classification produced YOLO9000.
- YOLO9000 can detect more than 9000 object categories in real time.
- And YOLOv3 has come out.

## Finale

- Object recognition has moved rapidly in the last 12 years to becoming very appearance based.
- The HOG descriptor lead to fast recognition of specific views of generic objects, starting with pedestrians and using SVMs.
- Deformable parts models extended that to allow more objects with articulated limbs, but still specific views.
- CNNs have become the method of choice; they learn from huge amounts of data and can learn multiple views of each object class.
- YOLO is one of the best.
