Parametric surfaces

Reading

Required:

 Angel readings for "Parametric Curves" lecture, with emphasis on 11.1.2, 11.1.3, 11.1.5, 11.6.2, 11.7.3, 11.9.4.

Optional

• Bartels, Beatty, and Barsky. An Introduction to Splines for use in Computer Graphics and Geometric Modeling, 1987.

_

Mathematical surface representations

- Explicit z=f(x,y) (a.k.a., a "height field")
 - what if the curve isn't a function?

• Implicit g(x,y,z) = 0

• Parametric S(u,v)=(x(u,v),y(u,v),z(u,v))

• For the sphere:

 $x(u,v) = r \cos 2\pi v \sin \pi u$

 $y(u,v) = r \sin 2\pi v \sin \pi u$

 $z(u,v) = r \cos \pi u$

As with curves, we'll focus on parametric surfaces.

Surfaces of revolution

Idea: rotate a 2D profile curve around an axis.

What kinds of shapes can you model this way?

Constructing surfaces of revolution

Given: A curve C(u) in the xy-plane:

$$C(u) = \begin{bmatrix} c_x(u) \\ c_y(u) \\ 0 \\ 1 \end{bmatrix}$$

Let $R_x(\theta)$ be a rotation about the *x*-axis.

Find: A surface S(u,v) which is C(u) rotated about the *x*-axis.

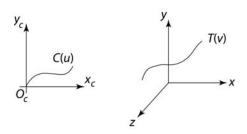

Solution:

5

General sweep surfaces

The **surface of revolution** is a special case of a **swept surface**.

Idea: Trace out surface S(u,v) by moving a **profile curve** C(u) along a **trajectory curve** T(v).

More specifically:

- Suppose that C(u) lies in an (x_c,y_c) coordinate system with origin O_c.
- For every point along T(v), lay C(u) so that O_c coincides with T(v).

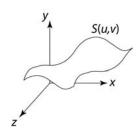

Orientation

The big issue:

• How to orient C(u) as it moves along T(v)?

Here are two options:

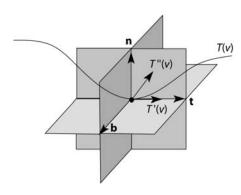

1. **Fixed** (or **static**): Just translate O_c along T(v).

- 2. Moving. Use the **Frenet frame** of T(v).
 - Allows smoothly varying orientation.
 - Permits surfaces of revolution, for example.

Frenet frames

Motivation: Given a curve T(v), we want to attach a smoothly varying coordinate system.

To get a 3D coordinate system, we need 3 independent direction vectors.

 $\mathbf{t}(v) = \text{normalize}[T'(v)]$

 $\mathbf{b}(v) = \text{normalize}[T'(v) \times T''(v)]$

 $\mathbf{n}(v) = \mathbf{b}(v) \times \mathbf{t}(v)$

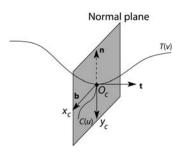

As we move along T(v), the Frenet frame (t,b,n) varies smoothly.

6

Frenet swept surfaces

Orient the profile curve C(u) using the Frenet frame of the trajectory T(v):

- Put C(u) in the **normal plane**.
- Place O_c on T(v).
- Align x_c for C(u) with **b**.
- Align y_c for C(u) with -**n**.

If T(v) is a circle, you get a surface of revolution exactly!

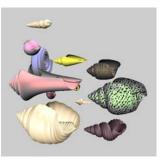

Where might these frames be ambiguous or undetermined?

Variations

Several variations are possible:

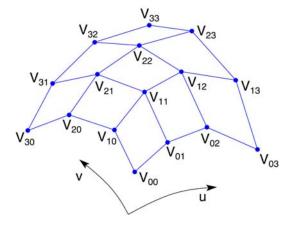

- Scale C(u) as it moves, possibly using length of T(v) as a scale factor.
- Morph C(u) into some other curve Q(u) as it moves along T(v).
- ٠ ...

10

Tensor product Bézier surfaces

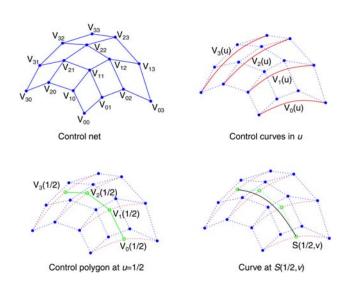

Given a grid of control points V_{ij} , forming a **control net**, contruct a surface S(u,v) by:

- treating rows of V (the matrix consisting of the V_{ij}) as control points for curves V₀(u),..., V_n(u).
- treating V₀(u),..., V_n(u) as control points for a curve parameterized by v.

Tensor product Bézier surfaces, cont.

Let's walk through the steps:

Which control points are interpolated by the surface?

11

Matrix form of Bézier curves and surfaces

Recall that Bézier curves can be written in terms of the Bernstein polynomials:

$$Q(u) = \sum_{i=0}^{n} V_i b_i(u)$$

They can also be written in a matrix form:

$$Q^{T}(u) = \begin{bmatrix} u^{3} & u^{2} & u & 1 \end{bmatrix} \begin{bmatrix} -1 & 3 & -3 & 1 \\ 3 & -6 & 3 & 0 \\ -3 & 3 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} V_{0}^{T} \\ V_{2}^{T} \\ V_{3}^{T} \end{bmatrix}$$

$$= \begin{bmatrix} u^3 & u^2 & u & 1 \end{bmatrix} \mathbf{M}_{\text{Bezier}} \mathbf{V}_{\text{curve}}$$

Tensor product surfaces can be written out similarly:

$$S(u,v) = \sum_{i=0}^{n} \sum_{j=0}^{n} V_{ij} b_i(u) b_j(v)$$

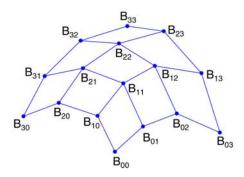

$$= \begin{bmatrix} u^3 & u^2 & u & 1 \end{bmatrix} \mathbf{M}_{\text{Bézier}} \mathbf{V}_{\text{surface}} \mathbf{M}_{\text{Bézier}}^T \begin{bmatrix} v^3 \\ v^2 \\ v \\ 1 \end{bmatrix}$$

13

15

Tensor product B-spline surfaces

As with spline curves, we can piece together a sequence of Bézier surfaces to make a spline surface. If we enforce C^2 continuity and local control, we get B-spline curves:

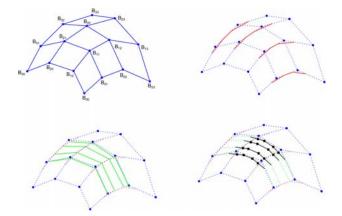

- treat rows of B as control points to generate Bézier control points in u.
- treat Bézier control points in u as B-spline control points in v.
- treat B-spline control points in v to generate Bézier control points in u.

14

16

Tensor product B-spline surfaces, cont.

Which B-spline control points are interpolated by the surface?

Matrix form of B-spline surfaces

Forcurves, we can write a matrix that generates Bezier control points from B-spline control points:

$$\begin{bmatrix} V_0^T \\ V_1^T \\ V_2^T \\ V_3^T \end{bmatrix} = \begin{bmatrix} 1 & 4 & 1 & 0 \\ 0 & 4 & 2 & 0 \\ 0 & 2 & 4 & 0 \\ 0 & 1 & 4 & 1 \end{bmatrix} \begin{bmatrix} B_0^T \\ B_2^T \\ B_2^T \end{bmatrix}$$

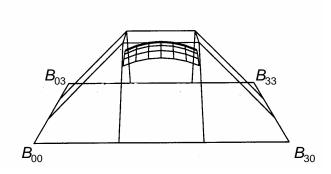

$$V_{curve} = M_{B-spline}B_{curve}$$

We can arrive at a similar form for tensor product B-spline surfaces:

$$V_{\text{surface}} = M_{\text{B-spline}} B_{\text{surface}} M_{\text{B-spline}}^T$$

Tensor product B-splines, cont.

Another example:

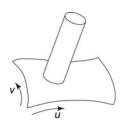

Trimmed NURBS surfaces

Uniform B-spline surfaces are a special case of NURBS surfaces.

Sometimes, we want to have control over which parts of a NURBS surface get drawn.

For example:

We can do this by **trimming** the u-v domain.

- Define a closed curve in the u-v domain (a trim curve)
- Do not draw the surface points inside of this curve.

It's really hard to maintain continuity in these regions, especially while animating.

17

Summary

What to take home:

- How to construct swept surfaces from a profile and trajectory curve:
 - · with a fixed frame
 - · with a Frenet frame
- How to construct tensor product Bézier surfaces
- How to construct tensor product B-spline surfaces

18
