Introduction

In the previous lecture, we figured out how to transform the geometry so that the relative sizes will be correct if we drop the z component.

But, how do we decide which geometry actually gets drawn to a pixel?

Known as the **hidden surface elimination problem** or the **visible surface determination problem**.

There are dozens of hidden surface algorithms.

We look at three prominent ones:

- Z-buffer
- Ray casting
- Binary space partitioning (BSP) trees

Z-buffer

The **Z-buffer** or **depth buffer** algorithm [Catmull, 1974] is probably the simplest and most widely used.

Here is pseudocode for the Z-buffer hidden surface algorithm:

```
for each pixel  $(i,j)$  do
    Z-buffer  $[i,j] \leftarrow FAR$ 
    Framebuffer $[i,j] \leftarrow <\text{background color}>$ 
end for
for each polygon A do
    for each pixel in A do
        Compute depth z and shade s of A at  $(i,j)$ 
        if  $z > Z\text{-buffer} [i,j]$  then
            Z-buffer  $[i,j] \leftarrow z$ 
            Framebuffer $[i,j] \leftarrow s$ 
        end if
    end for
end for
```

Q: What should FAR be set to?

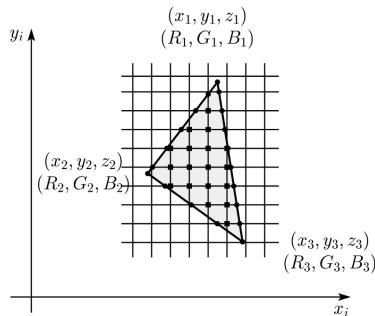

3

4

Rasterization

The process of filling in the pixels inside of a polygon is called **rasterization**.

During rasterization, the z value and shade s can be computed incrementally (fast!).

Curious fact:

- Described as the “brute-force image space algorithm” by [SSS]
- Mentioned only in Appendix B of [SSS] as a point of comparison for huge memories, but written off as totally impractical.

Today, Z-buffers are commonly implemented in hardware.

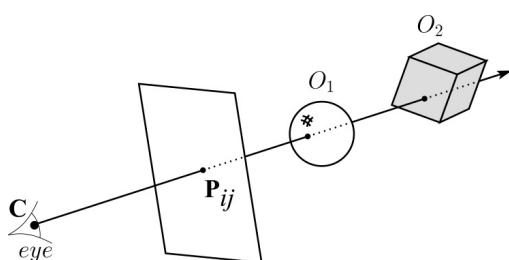

Z-buffer: Analysis

- Easy to implement?
- Easy to implement in hardware?
- Incremental drawing calculations (uses coherence)?
- Pre-processing required?
- On-line (doesn’t need all objects before drawing begins)?
- If objects move, does it take more work than normal to draw the frame?
- If the viewer moves, does it take more work than normal to draw the frame?
- Typically polygon-based?
- Efficient shading (doesn’t compute colors of hidden surfaces)?
- Handles transparency?
- Handles refraction?

5

6

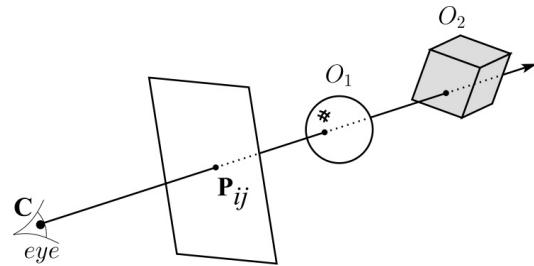

Ray casting

Idea: For each pixel center P_{ij}

- Send ray from eye point (COP), \mathbf{C} , through P_{ij} into scene.
- Intersect ray with each object.
- Select nearest intersection.

Ray casting, cont.

Implementation:

- Might parameterize each ray:
- $$\mathbf{r}(t) = \mathbf{C} + t(\mathbf{P}_{ij} - \mathbf{C})$$
- where $t > 0$.
- Each object O_k returns $t_k > 0$ such that first intersection with O_k occurs at $\mathbf{r}(t_k)$.

Q: Given the set $\{t_k\}$ what is the first intersection point?

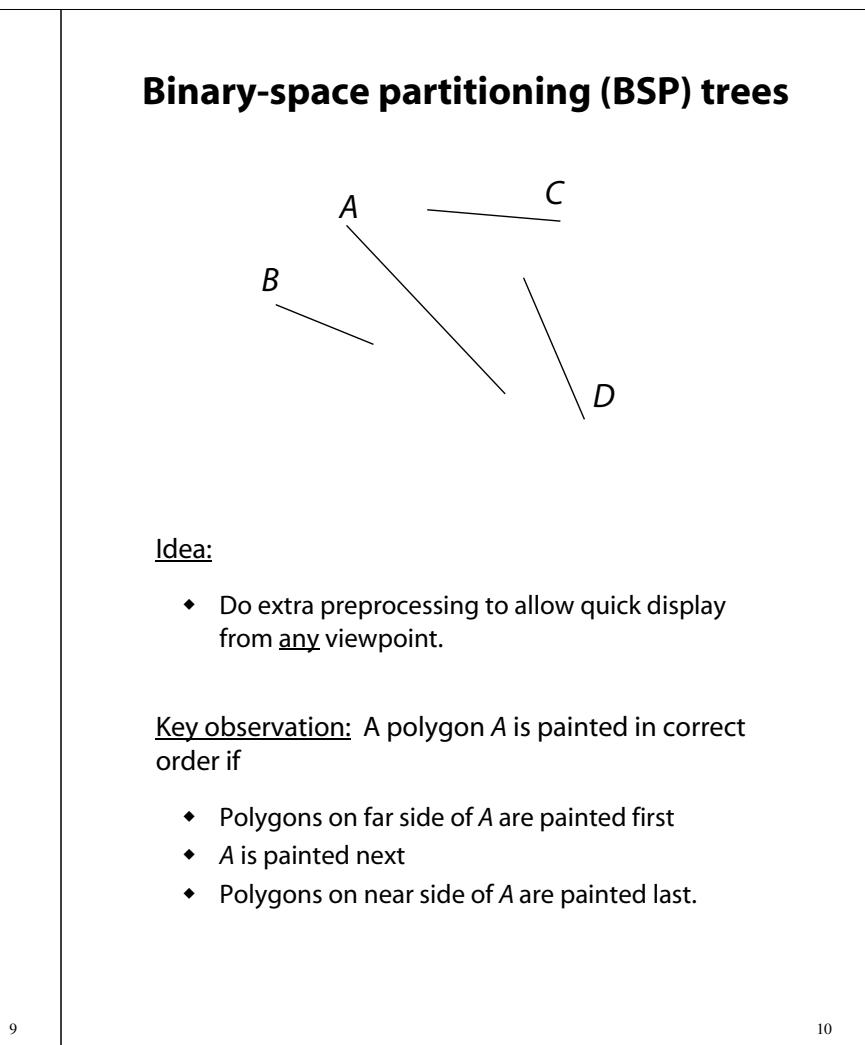

Note: these calculations generally happen in world coordinates. No projective matrices are applied.

8

Ray casting: Analysis

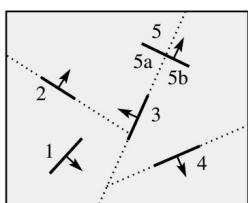

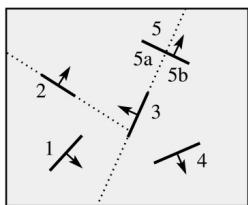

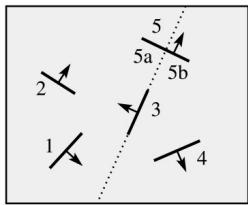

- Easy to implement?
- Easy to implement in hardware?
- Incremental drawing calculations (uses coherence)?
- Pre-processing required?
- On-line (doesn't need all objects before drawing begins)?
- If objects move, does it take more work than normal to draw the frame?
- If the viewer moves, does it take more work than normal to draw the frame?
- Typically polygon-based?
- Efficient shading (doesn't compute colors of hidden surfaces)?
- Handles transparency?
- Handles refraction?

9

10

BSP tree creation

BSP tree creation (cont'd)

procedure *MakeBSPTree*:

takes *PolygonList L*

returns *BSPTree*

Choose polygon A from L to serve as root

Split all polygons in L according to A

$\text{node} \leftarrow A$

$\text{node.neg} \leftarrow \text{MakeBSPTree}(\text{Polygons on neg. side of } A)$

$\text{node.pos} \leftarrow \text{MakeBSPTree}(\text{Polygons on pos. side of } A)$

return node

end procedure

Note: Performance is improved when fewer polygons are split --- in practice, best of ~ 5 random splitting polygons are chosen.

Note: BSP is created in *world* coordinates. No projective matrices are applied before building tree.

BSP tree display

procedure *DisplayBSPTree*:

Takes *BSPTree T, Point COP*

if *T* is empty **then return**

if *COP* is in front (on pos. side) of *T.node*

DisplayBSPTree(T._____)

Draw T.node

DisplayBSPTree(T._____)

else

DisplayBSPTree(T._____)

Draw T.node

DisplayBSPTree(T._____)

end if

end procedure

BSP trees: Analysis

- ◆ Easy to implement?
- ◆ Easy to implement in hardware?
- ◆ Incremental drawing calculations (uses coherence)?
- ◆ Pre-processing required?
- ◆ On-line (doesn't need all objects before drawing begins)?
- ◆ If objects move, does it take more work than normal to draw the frame?
- ◆ If the viewer moves, does it take more work than normal to draw the frame?
- ◆ Typically polygon-based?
- ◆ Efficient shading (doesn't compute colors of hidden surfaces)?
- ◆ Handles transparency?
- ◆ Handles refraction?

Summary

What to take home from this lecture:

- ◆ Understanding of three hidden surface algorithms:
 - Z-buffering
 - Ray casting
 - BSP tree creation and traversal
