

CSE 466 – Software for Embedded Systems

- **Instructor:**

- Bruce Hemingway
 - CSE 464, Office Hours: 1:30-2:30 p.m., Monday, Wednesday,
 - or whenever the door is open
 - bruceh@cs.washington.edu

- **Teaching Assistants:**

- Phil Roan
- and Brian Mayton, IRS

CSE 466 – Software for Embedded Systems

- **Class Meeting Times and Location:**

- Lectures: EE 003, MWF 12:30-1:20
- Lab: CSE 003E, Tuesday, 2:30-5:20

- **Exams**

- Midterm: Wednesday, 11 February, EE 003, 12:30-1:20
- Final: Thursday, 19 March, EE 003, 8:30-10:20

CSE 466 – Software for Embedded Systems

■ Grading Policy

- There will be two exams, as shown on the class schedule.
- Lab reports: Demo usually required, sometimes questions

■ Ratios:

- Lab: 50%
- Exams total: 20%
- Homework: 10% (reports)
- Class Participation: 20%

Embedded systems

Embedded system – from the web

■ Definitions

- A device not independently programmable by the user.
- Specialized computing devices that are not deployed as general purpose computers.
- A specialized computer system which is dedicated to a specific task.
- An embedded system is preprogrammed to perform a narrow range of functions with minimal end user or operator intervention.

Embedded system – from the web

■ What it is made of

- Embedded systems range in size from a single processing board to systems with operating systems.
- A combination of computer hardware and software, and perhaps additional mechanical or other parts, designed to perform a dedicated function.
- In some cases, embedded systems are part of a larger system or product, as is the case of an anti-lock braking system in a car.
- A specialized computer system that is part of a larger system or machine.
- Typically, an embedded system is housed on a single microprocessor board with the programs stored in ROM.
- Some embedded systems include an operating system, but many are so small and specialized that the entire logic can be implemented as a single program.

Embedded system – from the web

■ Examples

- Virtually all appliances that have a digital interface -- watches, microwaves, VCRs, cars -- utilize embedded systems.
- A computer system dedicated to controlling some non-computing hardware, like a washing machine, a car engine or a missile.
- Examples of embedded systems are medical equipment and manufacturing equipment.
- While most consumers aren't aware that they exist, they are extremely common, ranging from industrial systems to VCRs and many net devices.

What is an embedded system?

■ Different than a desktop system

- Fixed or semi-fixed functionality (not user programmable)
- Different human interfaces than screen, keyboard, mouse, audio
- Usually has sensors and actuators for interface to physical world
- May have stringent real-time requirements

■ It may:

- Replace discrete logic circuits
- Replace analog circuits
- Provide feature implementation path
- Make maintenance easier
- Protect intellectual property
- Improve mechanical performance

What do these differences imply?

- Less emphasis on
 - Graphical user interface
 - Dynamic linking and loading
 - Virtual memory, protection modes
 - Disks and file systems
 - Processes
- More emphasis on
 - Real-time support, interrupts (very small OS, if we're lucky)
 - Tasks (threads)
 - Task communication primitives
 - General-purpose input/output
 - Analog-digital/digital-analog converters
 - Timers
 - Event capture
 - Pulse-width modulation
 - Built-in communication protocols

What is an embedded system? (cont'd)

- Figures of merit for embedded systems
 - Reliability – it should never crash
 - Safety – controls things that move and can harm/kill a person
 - Power consumption – may run on limited power supply
 - Cost – engineering cost, manufacturing cost, schedule tradeoffs
 - Product life cycle – maintainability, upgradeability, serviceability
 - Performance – real-time requirements, power budget

Example: a temperature controller

Task: Tachometer (external interrupt)

```
now = getTime();
period = then - now; //overflow?
then = now;
return;
```

Task: TempControl (periodic, soft constraint)

```
if (Temp > setpoint) Thi++;
if (Temp < setpoint) Thi--;
if (period < min || period > max) PD0 = 1;
```

Task: FanPWM (periodic, hard constraint)

```
count++;
if (count == 0) PD6 = 1;
if (count > Thi) PD6 = 0;
return;
```

Task: Main

```
Thi = 0;
setup timer for 1ms interrupt;
setup timer for 100ms interrupt;
while (1);
```

Capacity

- Assume:
 - 8 MHz processor @ one instruction/cycle
 - Assume fan runs between 30Hz and 60Hz
 - Assume 256ms period on speed control PWM, with 1ms resolution.
- What percent of the the available cycles are used for the temperature controller?
 - $[\text{total instructions in one second}] / (8\text{MInstr/sec})$
- How much RAM do you need?
- How much ROM?

Resource analysis of temp controller

Task: Tachometer (external interrupt)

```
now = getTime();  
period = then - now; //overflow?  
then = now;  
return;
```

Task: FanPWM (periodic, hard constraint)

```
count++;  
if (count == 0) GP0 = 1;  
if (count > Thi) GP0 = 0;  
return;
```

Task: TempControl (periodic, soft constraint)

```
if (Temp > setpoint) Thi++;  
if (Temp < setpoint) Thi--;  
if (period < min || period > max) GP4 = 1;
```

Task: Main

```
Thi = 0;  
setup timer for 1ms interrupt;  
setup timer for 100ms interrupt;  
while (1);
```

Task	ROM	RAM	Instructions/Sec
Tach	~4	2 (period, then)	4 * 60 = 240
FanPWM	~8	1 (count)	8 * 1000 = 8000
TempControl	~10	1 (THI)	10 * 2 = 20

Total Instructions/Sec = 8260, at 8MIPS, that's only 0.1% utilization!

Other resources? local variables, stack

Class logistics – see course web

- <http://www.cs.washington.edu/education/courses/cse466/09wi/>
- Class structure
- Business matters
- Grading
- Syllabus
- What we'll be doing

Class structure

- Lecture
 - Closely linked to laboratory assignments
 - Cover main concepts, introduce laboratory problems
- Lab
 - Implementation of two projects
 - Lab reports due prior with 30 minutes of start of next lab section
- Exams
 - Two, based on lecture, lab, and datasheet reading
- Final demo
 - During last class time – participation required

Business Matters

- Lecture slides will be on line after class (links in several places)
- Random lab partner assignments, changed mid-quarter
- Sign up for CSE466 mailing list

Grading

- **Lab reports:**
 - Demonstration(s) required
 - Brief answers to questions embedded in assignment
 - Sometimes hand-in code
 - Do with your partner

- **Distribution:**
 - Labs: 50%
 - Exams: 20%
 - Homework: 10%
 - Class Participation: 20%

CSE466 Lab Projects

- **Two multi-week projects**
 - Four lab assignments each
 - Different lab partners
- **First project**
 - Familiarize with microcontroller
 - Learn how to interface various devices
 - Testing and debugging
 - Basic communication between chips and between chip and PC
- **Second project**
 - Wireless communication
 - Embedded operating system
 - Real-time issues
 - Testing and debugging
 - Emergent behavior of a collection of devices

CSE466 Lab Projects (cont'd)

- Project 1 – USB device
 - Platform: ATmega16 AVR microcontroller
 - Accelerometer and push-button used to control a tri-color LED
 - Connects sensor and actuator to PC through USB port
 - **Color Controller**
 - Tilt the controller to change color mix
 - Accelerometer senses movement – tilting
 - Mapping problem- two axes of motion to three-color space
 - Make a one-button virtual mouse
 - Tilt the accelerometer to move the PC cursor

CSE466 Lab Projects (cont'd)

- Project 2 – Ad hoc wireless network (“Mr. Poe”)
 - Platform: Intel iMote2
 - Sound generation coordinated with neighbors and time of day
 - Emergent behavior between different nodes
 - **Mr. Poe-- magnet poetry**
 - Install in Allen Center atrium for pleasing auditory display
 - On-the-fly poetry
 - Wireless nodes say words
 - And react to neighbors words
