Page 1

One View of Sound

Sound is a waveform,
we can record it, store it,
and play it back accurately

PCM playback is all we need for
interactions, movies, games, etc.

But, take one visual analogy:

*"If I take lots of polaroid images, I can flip through
them real fast and make any image sequence"*

Interaction? We manipulate lots of PCM

Page 2

Views of Sound

- Time Domain $x(t)$
(from physics, and time's arrow)
- Frequency Domain $X(f)$
(from math, and perception)
- Production what caused it
- Perception our "image" of it

Page 3

Views of Sound

- The Time Domain
is most closely related to
Production
- The Frequency Domain
is most closely related to
Perception

Page 4

Views of Sound: Time Domain

Sound is produced/ modeled by physics,
described by quantities of

- Force force = mass * acceleration
- Position $x(t)$ actually $[x(t), y(t), z(t)]$
- Velocity Rate of change of position dx/dt
- Acceleration Rate of change of velocity
(2nd derivative of position) dv/dt
 d^2x/dt^2

Examples: Mass, Spring, Damper Wave Equation

Page 5

Mass/Spring/Damper

$$F = ma = -ky - rv - mg$$

$$ma = -ky - rv$$

(if gravity negligible)

Solution:

$$\frac{d^2y}{dt^2} + \frac{r}{m} \frac{dy}{dt} + \frac{k}{m} y = 0$$

Page 6

2nd Order Linear Diff Eq. Solution

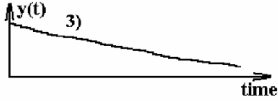

1) Underdamped:
 $y(t) = Y_0 e^{-t/\tau} \cos(\omega t)$
 exp. * oscillation

2) Critically damped:
 fast exponential decay

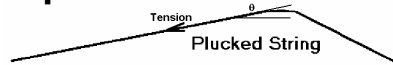

3) Overdamped:
 slow exponential decay

Page 7

The Wave Equation

$df_y = (T \sin\theta)_{x+dx} - (T \sin\theta)_x$ (for each dx of string)

$f(x+dx) = f(x) + \delta f / \delta x dx + \dots$ (Taylor's series in space)

assume $\sin \theta = \theta$ (for small θ)

$F = ma = \rho dx d^2y / dt^2$ ($\rho = \text{mass/length}$)

Solution:
 The wave equation $\frac{d^2 y}{dx^2} = \frac{1}{c^2} \frac{d^2 y}{dt^2}$
 $(c^2 = T / \rho)$

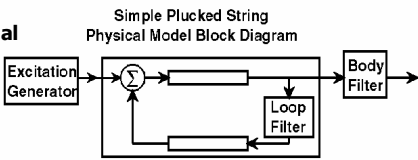

Page 8

Traveling Wave String Solution

D'Alembert Solution of $f(ct - x)$ and $g(ct + x)$
 (left and right going waves)

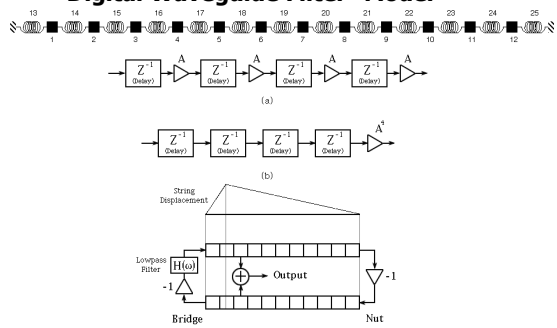

"Digital Waveguide Filter" Model (Smith)

- Bi-directional delay lines
- Filters for loss, radiation, other

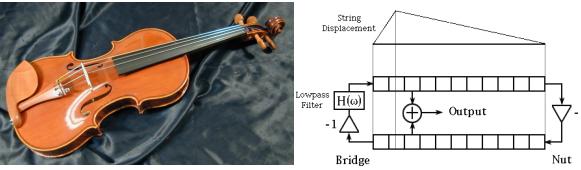

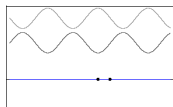

Page 9

"Digital Waveguide Filter" Model

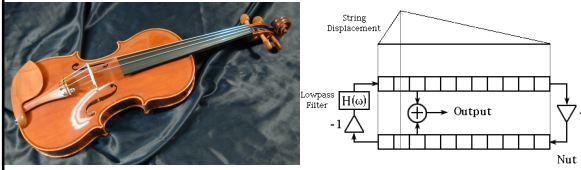

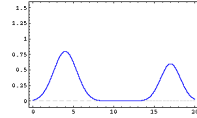

Page 10

"Digital Waveguide Filter" Model

Page 11

"Digital Waveguide Filter" Model

"Digital Waveguide Filter" Model

Page 13

Modal String Solution

- Superimposed **spatial sine waves** (modes derive from spatial "boundary conditions")
- Modes result in frequency "partials" (in time)
- Harmonic ($f, 2f, 3f$, etc.) relationship (speed of sound $c = \text{constant}$)
- Stiffness can cause minor stretching of harmonic frequencies ($c(f)$)

Page 14

Modal Solution for Bars

- Bars are often free at one or both ends

- Spatial modal solution still holds
- Modes no longer harmonic. Stiffness of rigid bars "stretches" frequencies.
- Modes: $f, 2.765f, 5.404f, 8.933f$, etc.

Page 15

Modal Synthesis (Adrien)

- Impulse generator excites filters
- Filters shape spectrum, model eigenmodes
- Filter parameters can be time-varying

Page 16

Stiffness in Bars

- Stiffness makes wave propagation frequency dependent ($c(f)$)
- Models:
 - Modal partials
 - Use all-pass phase filter to "stretch" waveguide harmonics
 - Merge waveguide with modal by modeling each mode with filter and delay

Page 17

Stiffness

All-pass waveguide (Smith & Jaffe)

- Acoustics View: Frequency dependent propagation
- Filter View: Stretch comb filter harmonics

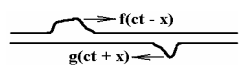

Banded waveguides (Essl)

- Acoustics View: Wave train closures
- Filter View: Comb filters with one resonance each

Page 18

Tubes

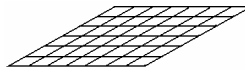

- Open or closed at either end
- Wave equation solution same as strings
- Modes always harmonic because speed of sound is constant with frequency
- Solutions:
 - Waveguide
 
 - or Modal
 

Open + Closed: odd 1/4 wavelengths

Page 19

Two and Higher Dimensions

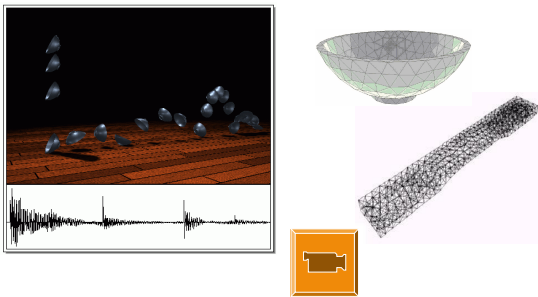

- 2 (N) Dimensional Waveguide Meshes
- or Finite Elements and Finite Differences
 - Discretize objects into cells (elements)
 - Express interactions between them
 - Express differential equation for system
 - Solve by discrete steps in space and time
- or Modal Solution

Page 20

Finite Elements

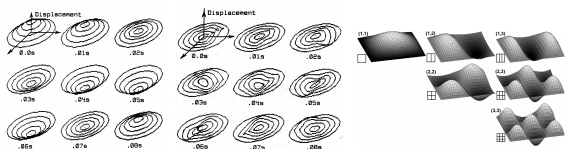

(with O'Brien and Essl)

Page 21

Hi-D Modal Solutions

Modes of Plates are inharmonic

Center strike Edge strike Square Plate Modes

round = Bessel function roots = sqrt(I) factors

Modes in higher dimensions are problematic (impossible analytically except in very simple cases)

Page 22

Where Are We So Far?

- Physical descriptions (equations)
- Give rise to solutions:
 1. Traveling Waves
 2. Spatial/Frequency Modes
- We can solve the equations directly using
 3. Finite Elements/Meshes
- How to choose? Are there more?

Page 23

Waveguides

- Strengths:
 - Cheap in both computation and memory
 - Parametrically meaningful, extensible for more realism
- Weaknesses:
 - Little in the real world looks, behaves, or sounds exactly like a plucked string, flute, etc.
 - Each family needs a different model
 - No general blind signal model

Page 24

Modal Modeling

- **Strengths:**
 - Generic, flexible, cheap if only a few modes
 - Great for modeling struck objects of metal, glass, wood
- **Weaknesses:**
 - No inherent spatial sampling
 - No (meaningful) phase delay
 - Hard to interact directly and continuously (rubbing, damping, etc).
 - No general blind signal model (closest)

Page 25

Meshes, Finite Elements

- **Strengths**
 - (somewhat) arbitrary geometries
 - Less assumptions than parametric forms
 - Can strike, damp, rub, introduce non-linearities at arbitrary points
- **Weaknesses:**
 - Expensive
 - Don't know all the computational solutions
 - Sampling in space/time (high Q problems)
 - Dispersion is strange (diagonals vs. not)
 - No general blind signal model

Page 26

Sound Views: Frequency Domain

- Many physical systems have modes (damped oscillations)
- Wave equation (2nd order) or Bar equation (4th order) need 2 or 4 "boundary conditions" for solution
- Once boundary conditions are set solutions are sums of exponentially damped sinusoidal modes
