

CSE 490 GZ
Introduction to Data Compression
Winter 2006

Arithmetic Coding:
Scaling, Context, Adaptation

Scaling

- Scaling:
 - By scaling we can keep L and R in a reasonable range of values so that $W = R - L$ does not underflow.
 - The code can be produced progressively, not at the end.
 - Complicates decoding some.

CSE 490g - Lecture 6 - Winter 2006

2

Scaling during Encoding

Lower half
If $[L,R)$ is contained in $[0,.5)$ then
 $L := 2L; R := 2R$
output 0, followed by C 0's
 $C := 0$.

Upper half
If $[L,R)$ is contained in $[\.5,1)$ then
 $L := 2L - 1; R := 2R - 1$
output 1, followed by C 0's
 $C := 0$

Middle Half
If $[L,R)$ is contained in $[\.25,\.75)$ then
 $L := 2L - .5; R := 2R - .5$
 $C := C + 1$.

5

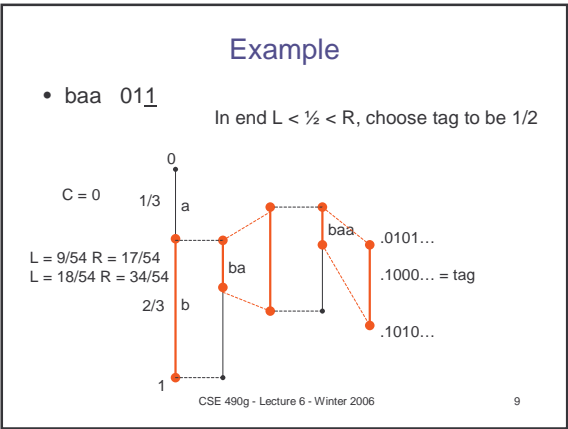

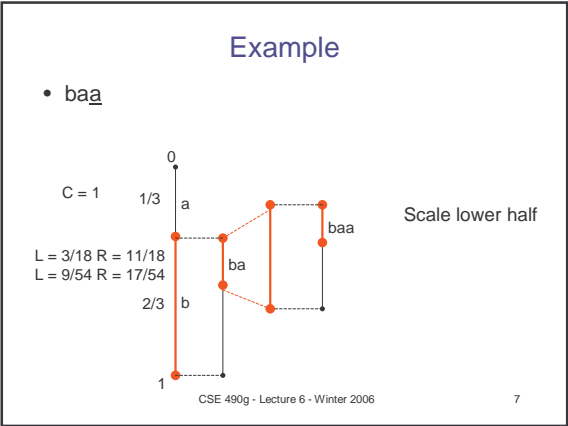

Example

- baa

CSE 490g - Lecture 6 - Winter 2006

6

Exercise

Model: $a: 1/4; b: 3/4$
 Encode: baa

CSE 490g - Lecture 6 - Winter 2006 10

Decoding

- The decoder behaves just like the encoder except that C does not need to be maintained.
- Instead, the input stream is consumed during when scaling.

CSE 490g - Lecture 6 - Winter 2006 11

Scaling during Decoding

Lower half
 If $[L, R]$ is contained in $[0, .5]$ then
 $L := 2L; R := 2R$
 consume 0 from the encoded stream

Upper half
 If $[L, R]$ is contained in $[.5, 1]$ then
 $L := 2L - 1; R := 2R - 1$
 consume 1 from the encoded stream

Middle half
 If $[L, R]$ is contained in $[.25, .75]$ then
 $L := 2L - .5; R := 2R - .5$
 Replace 01 with 0 on stream
 Replace 10 with 1 on stream

CSE 490g - Lecture 6 - Winter 2006 12

Scaling Math for the Tag

- Lower Half
 - $.0b_1b_2\dots \times 10 = .b_1b_2$
- Upper Half
 - $.1b_1b_2\dots \times 10 - 1 = .b_1b_2$
- Middle Half
 - $.01b_2b_3\dots \times 10 - .1 = .0b_2b_3$
 - $.10b_2b_3\dots \times 10 - .1 = .1b_2b_3$

CSE 490g - Lecture 6 - Winter 2006 13

Exercise

Model: a: 1/4; b: 3/4
 Decode: 001 to 3 symbols

CSE 490g - Lecture 6 - Winter 2006 14

Integer Implementation

- m bit integers
 - Represent 0 with 000...0 (m times)
 - Represent 1 with 111...1 (m times)
- Probabilities represented by frequencies
 - n_i is the number of times that symbol a_i occurs
 - $C_i = n_1 + n_2 + \dots + n_{i-1}$
 - $N = n_1 + n_2 + \dots + n_m$

$$W := R - L + 1$$

$$L' := L + \left\lfloor \frac{W \cdot C_i}{N} \right\rfloor$$

$$R := L + \left\lfloor \frac{W \cdot C_{i+1}}{N} \right\rfloor - 1$$

$$L := L'$$

Coding the i -th symbol using integer calculations. Must use scaling!

CSE 490g - Lecture 6 - Winter 2006 15

Context

- Consider 1 symbol context.
- Example: 3 contexts.

| | | | |
|------|------|-----|----|
| | next | | |
| | a | b | c |
| prev | .4 | .2 | .4 |
| | .1 | .8 | .1 |
| | .25 | .25 | .5 |

CSE 490g - Lecture 6 - Winter 2006 16

Example with Scaling

- acc

Code = 0101

Equally Likely model CSE 490g - Lecture 6 - Winter 2006 17

Arithmetic Coding with Context

- Maintain the probabilities for each context.
- For the first symbol use the equal probability model
- For each successive symbol use the model for the previous symbol.

CSE 490g - Lecture 6 - Winter 2006 18

Adaptation

- Simple solution – **Equally Probable Model**.
 - Initially all symbols have frequency 1.
 - After symbol x is coded, increment its frequency by 1
 - Use the new model for coding the next symbol
- Example in alphabet a,b,c,d

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| | a | a | b | a | a | c | |
| a | 1 | 2 | 3 | 3 | 4 | 5 | 5 |
| b | 1 | 1 | 1 | 2 | 2 | 2 | 2 |
| c | 1 | 1 | 1 | 1 | 1 | 1 | 2 |
| d | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

After aabaac is encoded
The probability model is
a 5/10 b 2/10
c 2/10 d 1/10

CSE 490g - Lecture 6 - Winter 2006

19

Zero Frequency Problem

- How do we weight symbols that have not occurred yet.
 - Equal weights? Not so good with many symbols
 - Escape symbol, but what should its weight be?
 - When a new symbol is encountered send the <esc>, followed by the symbol in the equally probable model. (Both encoded arithmetically.)

| | | | | | | | |
|-------|---|---|---|---|---|---|---|
| | a | a | b | a | a | c | |
| a | 0 | 1 | 2 | 2 | 3 | 4 | 4 |
| b | 0 | 0 | 0 | 1 | 1 | 1 | 1 |
| c | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| d | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| <esc> | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

After aabaac is encoded
The probability model is
a 4/7 b 1/7
c 1/7 d 0
<esc> 1/7

CSE 490g - Lecture 6 - Winter 2006

20

PPM

- Prediction with Partial Matching
 - Cleary and Witten (1984)
- State of the art arithmetic coder
 - Arbitrary order context
 - The context chosen is one that does a good prediction given the past
 - Adaptive
- Example
 - Context "the" does not predict the next symbol "a" well. Move to the context "he" which does.

CSE 490g - Lecture 6 - Winter 2006

21

Arithmetic vs. Huffman

- Both compress very well. For m symbol grouping.
 - Huffman is within $1/m$ of entropy.
 - Arithmetic is within $2/m$ of entropy.
- Context
 - Huffman needs a tree for every context.
 - Arithmetic needs a small table of frequencies for every context.
- Adaptation
 - Huffman has an elaborate adaptive algorithm
 - Arithmetic has a simple adaptive mechanism.
- Bottom Line – Arithmetic is more flexible than Huffman.
