

## Topics in Information Display

IMAGES DELETED

CSE 510  
Richard Anderson  
Ken Fishkin

Jan 13, 2003

CSE 510 - Winter 2003

## My Homework

- "When did CHI become a research focus"?
- SIGCHI - 1983
- UIST - 1986

Jan 13, 2003

CSE 510 - Winter 2003

## Administrivia

- "If you can only attend 1 lecture this quarter".....
  - Wednesday will be the "project gallery"
- **No** extra class 1/17
  - Class as scheduled 3/3

Jan 13, 2003

CSE 510 - Winter 2003

## Why Study This?

- How data is organized and presented has a dramatic effect on how the data is conceptualized

Jan 13, 2003

CSE 510 - Winter 2003

## Why Study This?

- "When principles of design replicate principles of thought, the act of arranging information becomes an act of insight"

Jan 13, 2003

CSE 510 - Winter 2003

## Why Study This?

- *Your* arrangement affects *others* insights

Jan 13, 2003

CSE 510 - Winter 2003

## Why Study This?

- “those who discover an explanation are often those who construct its representation”
- When you argue with data, it’s better to have the tools to argue well

Jan 13, 2003

CSE 510 - Winter 2003

## Why Study This?

- “More stunning is the observation that they *did* have the pertinent data. There were charts they did not image and did not construct that, if created, would have provided the quantitative correlational data required to sustain their position”

Jan 13, 2003

CSE 510 - Winter 2003

## Why Study This?

- Most engineers have *no* training in the visual arts.
- But are almost always tasked to make the charts
  - “Collectively, they decided they would need 13 charts. Lund assigned the responsibility for the charts, dividing it among people based on their specializations”

Jan 13, 2003

CSE 510 - Winter 2003

## Why study this?

- Like lawyers taking a course in public speaking
- You *will* be tasked to present your results
- It is very easy to make very bad presentations

Jan 13, 2003

CSE 510 - Winter 2003

## Tufte to the Rescue!

- Yale Prof in Stats.
- Presenting data is essential
- Has written a series of *very* influential books on designing information displays

Jan 13, 2003

CSE 510 - Winter 2003

## Limits of Tufte

- Ignores color-blindness (and visual impairment in general)
- Focus is on static displays – doesn’t really address interaction, multimedia, etc.
- We will discuss some of these in later lectures

Jan 13, 2003

CSE 510 - Winter 2003

## Art and Science

- Art: "nearly every escape from flatland demands extensive compromise, trading off one virtue against another"
  - Remember periodic table
- Science: "The principles of information design are universal - like mathematics - and are not tied to unique features of a particular language or culture"
  - perhaps not....

Jan 13, 2003 CSE 510 - Winter 2003

## Digression

- Graphs are (relatively) new
- Cartesian coordinates: 1628
- 1<sup>st</sup> 1D plot: 1644

Jan 13, 2003 CSE 510 - Winter 2003

## Digression

- 1<sup>st</sup> 2D plot
  - 1769
  - Lambert (as in "Lambertian shading")

Jan 13, 2003 CSE 510 - Winter 2003

## Digression

- 1<sup>st</sup> bar chart
  - 1786

Jan 13, 2003 CSE 510 - Winter 2003

## Digression

- Playfair: 1<sup>st</sup> (a) pie chart, (b) multivariate, (c) 2D shape
  - 1801

Jan 13, 2003 CSE 510 - Winter 2003

## PART 1: SHOW THE DATA, NOT THE WRAPPER

- Delete unnecessary elements ("Chartjunk")

Jan 13, 2003 CSE 510 - Winter 2003

## "Above all else, show the data"

- Rule: "Nothing can be erased without losing information" (or harming understanding)

Jan 13, 2003

CSE 510 - Winter 2003

## Occam's razor

- "the smallest effective difference is the Occam's razor of information design"
- "small differences allow *more* differences"

Jan 13, 2003

CSE 510 - Winter 2003

## Resist Moiré effects

- "Moiré effect is a visual perception that occurs when viewing a set of lines or dots that is superimposed on another set of lines or dots, where the sets differ in relative size, angle, or spacing."
- Generally, "vibration"/"noise"/"bleeding" from nearby graphic elements
- Very easy w/office software
- "noise clouds the flow of information"
- (<http://www.msamematik.com/Moire/>)

Jan 13, 2003

CSE 510 - Winter 2003

## More Moire

- Don't use cross-hatching

Jan 13, 2003

CSE 510 - Winter 2003

## More Moire

- Always use dark text on light, solid backgrounds
- WIRED effect
- "it causes 'visual vibration', eye fatigue, and inaccurate reading".
- Well-known in cognitive psych.

Jan 13, 2003

CSE 510 - Winter 2003

## Color: hue

- Avoid "visual puzzles", where "the graphic must be interpreted through a verbal rather than a visual process"

Jan 13, 2003

CSE 510 - Winter 2003

## Color:hue

- Why? "the mind's eye does not readily give a visual ordering to colors, except possibly for red to reflect higher levels"

Jan 13, 2003 CSE 510 - Winter 2003

## Color: hue

- Hue is *cognitively* a circle
- Mapping it to a line means that cognitively *adjacent* colors get "thrown" to opposite ends
- E.g. red and violet

Jan 13, 2003 CSE 510 - Winter 2003

## Color:hue

- Where graph A "splits the circle" may not be where graph B does.
- Green is lowest in left picture, middle in right

Jan 13, 2003 CSE 510 - Winter 2003

## Color: hue

- Once hue is used for an *ordered* quantity, what's left for unordered ones?

Jan 13, 2003 CSE 510 - Winter 2003

## What do you think?

Jan 13, 2003 CSE 510 - Winter 2003

## Color:hue

- "rainbow color-coding of quantitative data confounds what happens in a color scheme with what happens in the data"

Jan 13, 2003 CSE 510 - Winter 2003

## Color:hue

- Use lightness or saturation for a 1D ordering

Jan 13, 2003 CSE 510 - Winter 2003

## Color:hue

- Interpolate through white to interpolate 2 hues

Jan 13, 2003 CSE 510 - Winter 2003

## Color: hue

- Use *small spots of intense, saturated color*
- Grey better than white for background

Jan 13, 2003 CSE 510 - Winter 2003

## Digression

- "Use small spots of intense, saturated color" also a technique used in cinema to highlight
- Converse (graying out) also used to make things recede
- Might be useful when visualizing uncertainty (later lecture)

Jan 13, 2003 CSE 510 - Winter 2003

## Digression

- A common "quasi-hue" ordering is
  - Red: bad
  - Green: good
  - Yellow/Orange: middle
- "quasi-hue" because also appeals to traffic light metaphor
- Issue: doesn't work for 10% males of European descent (red-green color-blind)

Jan 13, 2003 CSE 510 - Winter 2003

## Color:hue: summary

- Only use hue for unordered quantities.
- Hue for a linear quantity is "an encoding that now and then reduces perplexed viewers to mumbling color names, and the numbers they represent... Despite our experiences with the spectrum in science textbooks and rainbows, the mind's eye does not readily give an order to ROYGBIV"
- How far is Red from Purple?
- Highest of all is white???

Jan 13, 2003 CSE 510 - Winter 2003

## Why Not?

---

- Quick, which are the highest and lowest rated movies?
  - Eyes going back and forth a sure sign of a bad mapping

Jan 13, 2003 CSE 510 - Winter 2003

## How about now?

---

Jan 13, 2003 CSE 510 - Winter 2003

## Don't shout

---

- All caps, especially if sans-serif, vibrate
- Also "minimize distinctions between letters and words, contributing to the difficulty of reading"

Jan 13, 2003 CSE 510 - Winter 2003

## PART 2: BEING TRUTHFUL

---

Jan 13, 2003 CSE 510 - Winter 2003

## Don't distort the data

---

- Don't change the X (or Y) scale in mid-stream

Jan 13, 2003 CSE 510 - Winter 2003

## Don't distort the data

---

- Use same scales in comparisons

Jan 13, 2003 CSE 510 - Winter 2003

## Don't distort the data

- Use same scales in comparisons

Jan 13, 2003 CSE 510 - Winter 2003

## Don't distort the data

- Be very careful with aggregation
- "time series are exquisitely sensitive to choices of intervals and end points"

Jan 13, 2003 CSE 510 - Winter 2003

## Size in graphic == size in data

- Adding perspective worsens the crime

Jan 13, 2003 CSE 510 - Winter 2003

## Size in graphic == size in data

- Don't use 3D for a 1D quantity... ever

Jan 13, 2003 CSE 510 - Winter 2003

## Put data in context

- Thiokol only looked at 2 or 8 data points, so could not trend.

Jan 13, 2003 CSE 510 - Winter 2003

## Put data in context

- Thiokol only looked at 8% of the data, so could not trend.

Jan 13, 2003 CSE 510 - Winter 2003

## Show data in context

- Show scale, orientation, and axes

Jan 13, 2003 CSE 510 - Winter 2003

## Charts not always the answer

- Charts have a cognitive "start-up cost", plus need to look over to axes
- If < 20 numbers, perhaps a table is better.

	Participation (%)
College or University	7
Adult	8
Total	15

Jan 13, 2003 CSE 510 - Winter 2003

## Homework

- "The owner of the memex, let us say, is interested in the origin and properties of the bow and arrow. Specifically he is studying why the short Turkish bow was apparently superior to the English long bow in the skirmishes of the Crusades"

Jan 13, 2003 CSE 510 - Winter 2003

## PART 3: ARGUING BETTER

Jan 13, 2003 CSE 510 - Winter 2003

## Cause-and-effect

- Put cause and effect on the axes, with cause on the X axis

What's wrong here?

- Cause/effect mismatch
- Chartjunk
- Extraneous data
- Encodings of damage

Jan 13, 2003 CSE 510 - Winter 2003

## Use thin lines for non-data, thick lines for data

Jan 13, 2003 CSE 510 - Winter 2003

## Minimize grid lines

- They are the “scaffolding”, should be hidden when you “drywall”

Jan 13, 2003

CSE 510 - Winter 2003

## Make graphs longer than high

- Analogy to the horizon
- X is typically “cause” axis, emphasizes it
- Try for the golden mean (1.618)
  - 1.0 ... 2.2 seems the range
  - But this way you can sound educated!

Jan 13, 2003

CSE 510 - Winter 2003

## Two small figures > 1 big one

- “Comparisons must be enforced within the scope of the eyespan”
- Why in this talk I do before and after on same slide

Jan 13, 2003

CSE 510 - Winter 2003

## Digression

- Chernoff faces
- Good for showing multiple plots on the same graph
- Exploits our ability to rapidly distinguish faces
- Scales down well

Jan 13, 2003

CSE 510 - Winter 2003

## Focus+Context

- Showing multiple levels of data in the same graphic can lend to analysis on both the *macro* (Context) and *micro* (Focus) level

Jan 13, 2003

CSE 510 - Winter 2003

## Focus+Context

- long established in art & architecture
- Another more meaningful example later

Jan 13, 2003

CSE 510 - Winter 2003

(Thanks to David Medjeska of U. Toronto)

## Focus+Context

- "Such designs can report immense detail, organizing complexity through multiple and (often) hierarchical layers of contextual reading"

Jan 13, 2003 CSE 510 - Winter 2003

## Focus+Context

- Don't be afraid of detail, challenge is to maximize it. Humans are very good at focus+context
- "micro/macro designs enforce both local and global comparisons and, at the same time, avoid the disruption of context switching"

Jan 13, 2003 CSE 510 - Winter 2003

## Focus+Context

- "Detail cumulates into larger coherent structures. Simplicity of reading derives from the context of detailed and complex information, properly arranged *to clarify and detail*"

Jan 13, 2003 CSE 510 - Winter 2003

## In sum

- Ask yourself: "what can be taken out?"
- Show data in context
- Use 1D representations of 1D quantities
- Maximize content, minimize annotation

Jan 13, 2003 CSE 510 - Winter 2003

## "The Worst Graphic Ever?"

Jan 13, 2003 CSE 510 - Winter 2003

## Example #1

- Shows French invasion of Russia
- Shows 6 variables seamlessly
- Shows relations
- Pure data
- "best statistical graphic ever"

Jan 13, 2003 CSE 510 - Winter 2003

## Example: Vietnam Memorial

---

Jan 13, 2003 CSE 510 - Winter 2003

## Example: Vietnam Memorial

- Focus + context:  
each contributes to  
the other

Jan 13, 2003 CSE 510 - Winter 2003

## Example: Vietnam Memorial

- Careful choice of X and Y axes
- Longer than high

Jan 13, 2003 CSE 510 - Winter 2003

## Example: Pioneer

*Your arrangement affects others insights*

Jan 13, 2003 CSE 510 - Winter 2003

## Homework

- Redo your homework for today. As before, work should fit on an 8" by 4" rectangle, and not suffer from faxing. No time constraints.

Jan 13, 2003 CSE 510 - Winter 2003

## Project proposal

- "The principles of information design are universal - like mathematics - and are not tied to unique features of a particular language or culture"
- Conduct user studies to test this hypothesis

Jan 13, 2003 CSE 510 - Winter 2003

## Project Proposal

- What do you think Tufte got wrong? Pick a rule of his, argue against it, and then justify your argument by experiment.

Jan 13, 2003 CSE 510 - Winter 2003

## Project Proposal

- Write a "Tufte-alyzer", that takes a Powerpoint presentation and detects "hall of shame" situations. Extra credit: suggest corrections.

Jan 13, 2003 CSE 510 - Winter 2003

## Project proposal

- CNBC and Yahoo must constantly dynamically create stock graphs. The aspect ratio is (largely) a given. How do they determine the Y axis (scale and offset)? How did they determine colors and fonts? What *should* they use?

Jan 13, 2003 CSE 510 - Winter 2003

## Project proposal

- Tukey's box-plot shows uncertainty for a 1D quantity in a plot.
- How would you show uncertainty for an  $n$ -d quantity in a visualization? (more on this later)

Jan 13, 2003 CSE 510 - Winter 2003
