Lecture 9 - Prefetching

What to prefetch on?

- Patterns of memory accesses (history):
 - Stride between misses (up/down)
 - General correlations
- Speculative threads
- Program counter / control flow
- Static model
- You can be told to prefetch
- Data
- Other processor or thread behavior

When to prefetch?

- Misses
 - The game is already lost!
 - Good enough
 - Information overload
- Which information stream has the right data in it?
Misses or hits or accesses?

Pitfalls?

- Waste of bandwidth
- Extra stuff:
 - Power, area, complexity
- Traffic on coherence bus
- Potentially hurt someone else in a MP system
-
