Tensor product Bézier surfaces

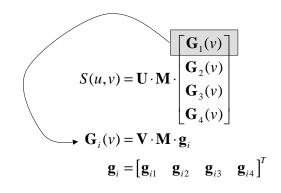

Given a grid of control points V_{ij} , forming a **control net**, contruct a surface S(u,v) by:

- treating rows of *V* as control points for curves $V_0(u),...,V_n(u)$.
- treating $V_0(u), \dots, V_n(u)$ as control points for a curve parameterized by v.

Building surfaces from curves

Let the geometry vector vary by a second parameter *v*:

Geometry matrices

By transposing the geometry curve we get:

$$\mathbf{G}_{i}(v)^{T} = (\mathbf{V} \cdot \mathbf{M} \cdot \mathbf{g}_{i})^{T}$$

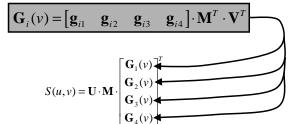

$$= \mathbf{g}_{i}^{T} \cdot \mathbf{M}^{T} \cdot \mathbf{V}^{T}$$

$$= [\mathbf{g}_{i1} \quad \mathbf{g}_{i2} \quad \mathbf{g}_{i3} \quad \mathbf{g}_{i4}] \cdot \mathbf{M}^{T} \cdot \mathbf{V}^{T}$$

Geometry matrices

Combining

And

We get

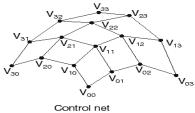

$$S(u,v) = \mathbf{U} \cdot \mathbf{M} \cdot \begin{bmatrix} \mathbf{g}_{11} & \mathbf{g}_{12} & \mathbf{g}_{13} & \mathbf{g}_{14} \\ \mathbf{g}_{21} & \mathbf{g}_{22} & \mathbf{g}_{23} & \mathbf{g}_{24} \\ \mathbf{g}_{31} & \mathbf{g}_{32} & \mathbf{g}_{33} & \mathbf{g}_{34} \\ \mathbf{g}_{41} & \mathbf{g}_{42} & \mathbf{g}_{43} & \mathbf{g}_{44} \end{bmatrix} \mathbf{M}^T \cdot \mathbf{V}^T$$

Tensor product surfaces, cont.

Let's walk through the steps:

 $V_3(u)$ $V_2(u)$ $V_0(u)$ Control curves in u

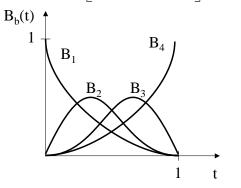

Which control points are interpolated by the surface?

Bezier Blending Functions

a.k.a. Bernstein polynomials

$$\mathbf{Q}(t) = \begin{bmatrix} t^3 & t^2 & t & 1 \end{bmatrix} \begin{bmatrix} -1 & 3 & -3 & 1 \\ 3 & -6 & 3 & 0 \\ -3 & 3 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} \mathbf{P}_1 \\ \mathbf{P}_2 \\ \mathbf{P}_3 \\ \mathbf{P}_4 \end{bmatrix} = \mathbf{B}_b(t) \begin{bmatrix} \mathbf{P}_1 \\ \mathbf{P}_2 \\ \mathbf{P}_3 \\ \mathbf{P}_4 \end{bmatrix}$$

Matrix form

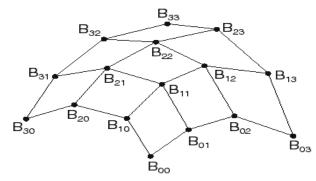

Tensor product surfaces can be written out explicitly:

$$S(u,v) = \sum_{i=0}^{n} \sum_{j=0}^{n} V_{ij} B_{i}^{n}(u) B_{j}^{n}(v)$$

$$= \begin{bmatrix} v^{3} & v^{2} & v & 1 \end{bmatrix} \mathbf{M}_{B\acute{e}zier} \quad \mathbf{V} \quad \mathbf{M}_{B\acute{e}zier}^{T} \begin{bmatrix} u^{3} \\ u^{2} \\ u \\ 1 \end{bmatrix}$$

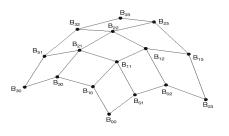

Tensor product B-spline surfaces

As with spline curves, we can piece together a sequence of Bézier surfaces to make a spline surface. If we enforce C2 continuity and local control, we get B-spline curves:

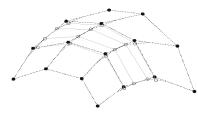

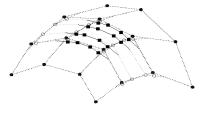

- treat rows of B as control points to generate Bézier control points in u.
- treat Bézier control points in *u* as B-spline control points in *v*.
- treat B-spline control points in v to generate Bézier control points in u.

Trimmed NURBS surfaces

Uniform B-spline surfaces are a special case of NURBS surfaces.

Sometimes, we want to have control over which parts of a NURBS surface get drawn.

For example:

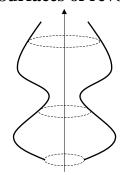

We can do this by **trimming** the u-v domain.

- Define a closed curve in the *u-v* domain (a **trim curve**)
- Do not draw the surface points inside of this curve.

It's really hard to maintain continuity in these regions, especially while animating.

Surfaces of revolution

Idea: rotate a 2D **profile curve** around an axis.

What kinds of shapes can you model this way?

13

Variations

Several variations are possible:

- Scale C(u) as it moves, possibly using length of T(v) as a scale factor.
- Morph C(u) into some other curve C'(u) as it moves along T(v).
- ***** ...

Constructing surfaces of revolution

Given: A curve C(u) in the yz-plane:

$$C(u) = \begin{bmatrix} 0 \\ c_y(u) \\ c_z(u) \\ 1 \end{bmatrix}$$

Let $R_r(\theta)$ be a rotation about the x-axis.

Find: A surface S(u,v) which is C(u) rotated about the *z*-axis.

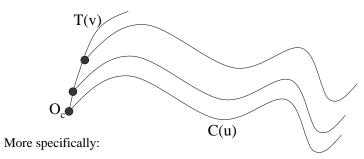

$$S(u,v) = \mathbf{R}_{\mathbf{x}}(v) \cdot C(u)$$

General sweep surfaces

The **surface of revolution** is a special case of a **swept surface**.

Idea: Trace out surface S(u,v) by moving a **profile curve** C(u) along a **trajectory curve** T(v).

$$S(u,v) = \mathbf{T}(T(v)) \cdot C(u)$$

- Suppose that C(u) lies in an (x_c, y_c) coordinate system with origin O_c .
- For every point along T(v), lay C(u) so that O_c coincides with T(v).

Orientation

The big issue:

• How to orient C(u) as it moves along T(v)?

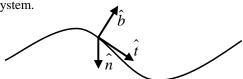

Here are two options:

- 1. **Fixed** (or **static**): Just translate O_c along T(v).
- 2. Moving. Use the **Frenet frame** of T(v).
 - Allows smoothly varying orientation.
 - Permits surfaces of revolution, for example.

17

Frenet frames

Motivation: Given a curve T(v), we want to attach a smoothly varying coordinate system.

To get a 3D coordinate system, we need 3 independent direction vectors.

$$\hat{t}(v) = normalize(T'(v))$$

$$\hat{b}(v) = normalize(T'(v) \times T''(v))$$

$$\hat{n}(v) = \hat{b}(v) \times \hat{t}(v)$$

As we move along T(v), the Frenet frame (t,b,n) varies smoothly.

Frenet swept surfaces

Orient the profile curve C(u) using the Frenet frame of the trajectory T(v):

- 1. Put C(u) in the **normal plane** nb.
- 2. Place O_c on T(v).
- 3. Align x_c for C(u) with -n.
- 4. Align y_c for C(u) with b.

If T(v) is a circle, you get a surface of revolution exactly?

Summary

What to take home:

- How to construct tensor product Bézier surfaces
- How to construct tensor product B-spline surfaces
- Surfaces of revolution
- Construction of swept surfaces from a profile and trajectory curve
 - With a fixed frame
 - With a Frenet frame
