

Object Class Recognition using Images of Abstract Regions

Yi Li, Jeff A. Bilmes, and Linda G. Shapiro
Department of Computer Science and Engineering
Department of Electrical Engineering
University of Washington

Problem Statement

Given: Some images and their corresponding descriptions

{trees, grass, cherry trees}

{cheetah, trunk}

{mountains, sky}

{beach, sky, trees, water}

...

To solve: What object classes are present in new images

?

?

?

?

...

Image Features for Object Recognition

- Color

- Texture

- Structure

- Context

Abstract Regions

Original Images

Color Regions

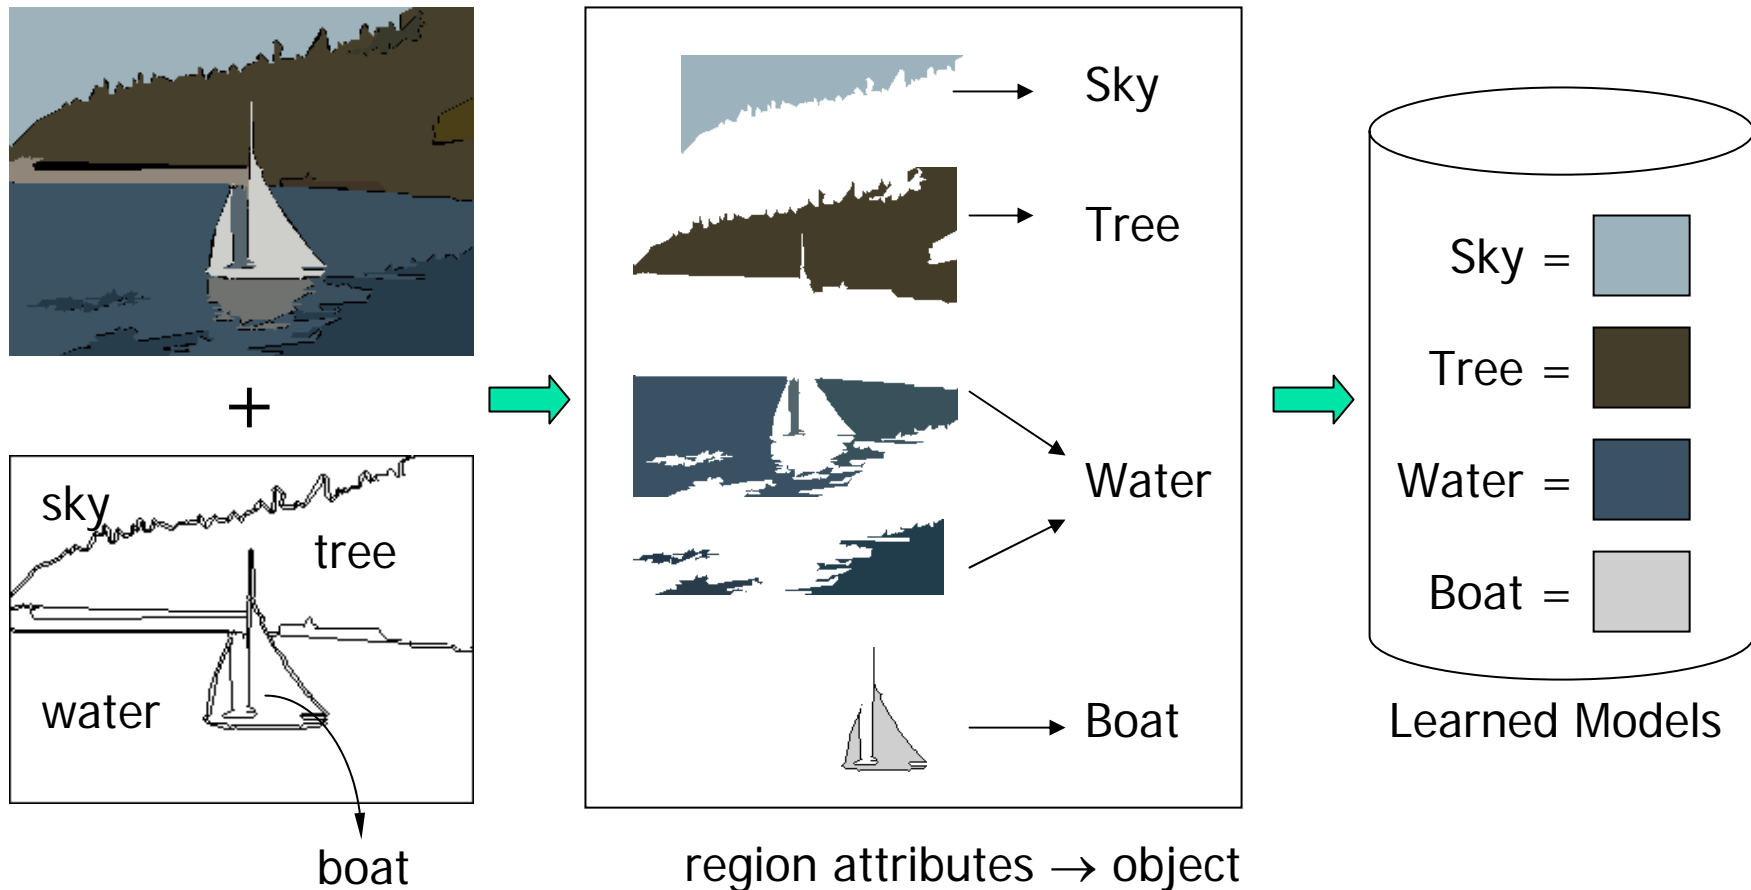

Texture Regions

Line Clusters

Object Model Learning (Ideal)

Our Scenario: Abstract Regions

Multiple segmentations whose regions are not labeled; a list of labels is provided for each training image.

image

labels

{sky, building}

various different segmentations

region attributes from several different types of regions

Object Model Learning

Assumptions

- The feature distribution of each **object** within a region is a **Gaussian**;
- Each image is a set of regions; each **region** can be modeled as a **mixture of multivariate Gaussian** distributions.

Model Initial Estimation

- Estimate the initial model of an object using all the region features from all images that contain the object

Tree

Sky

EM Variant

Initial Model for "trees"

Final Model for "trees"

Initial Model for "sky"

Final Model for "sky"

EM

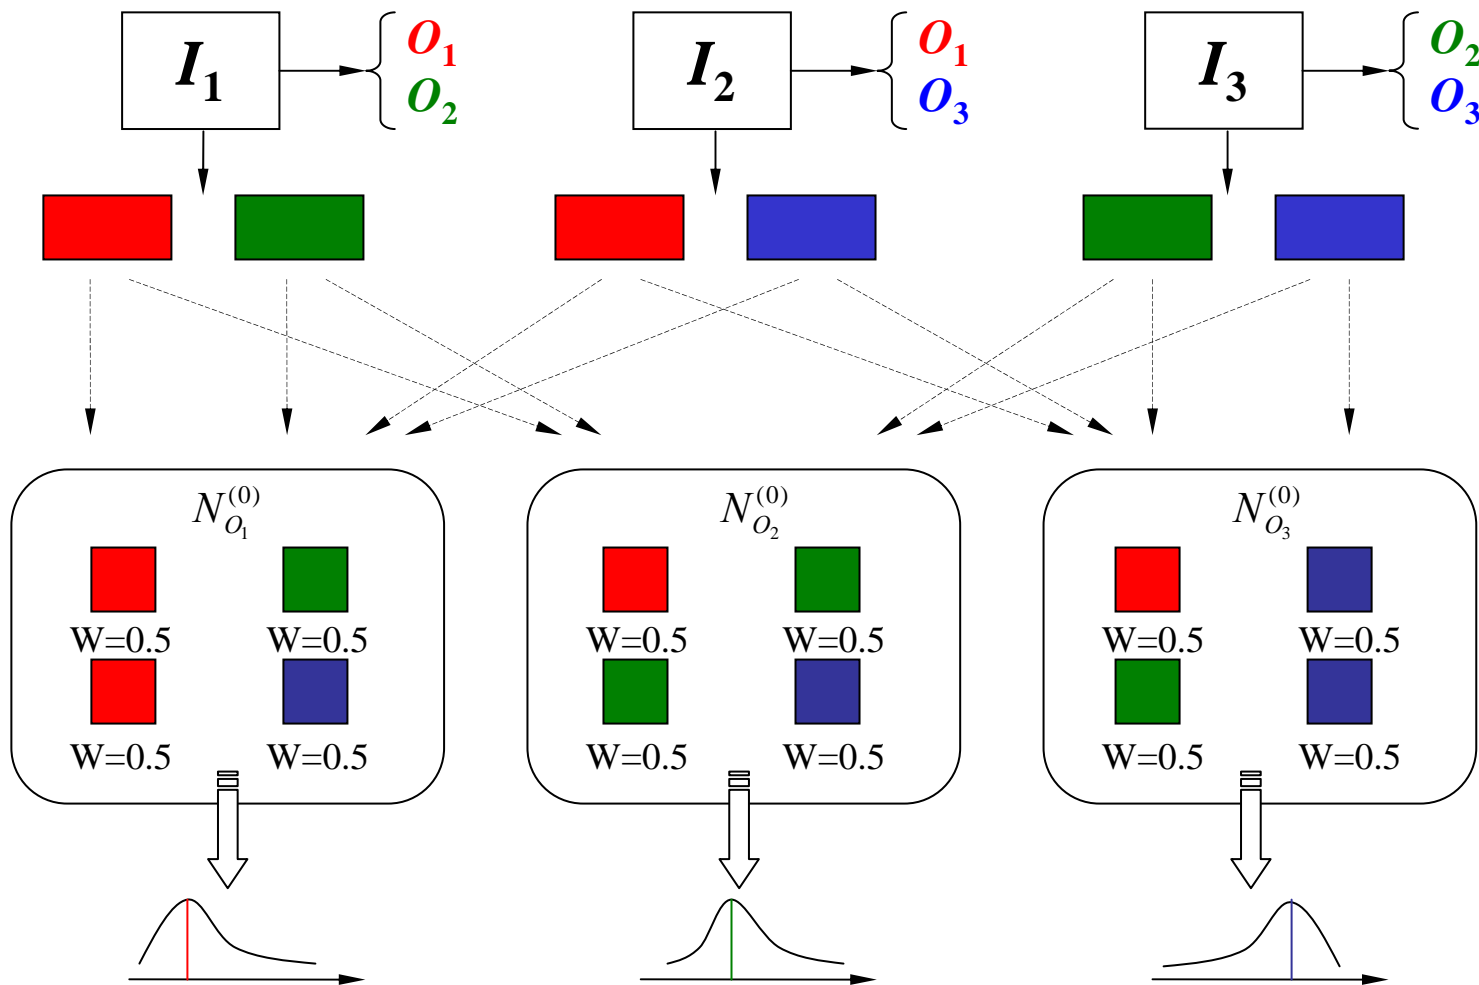

EM Variant

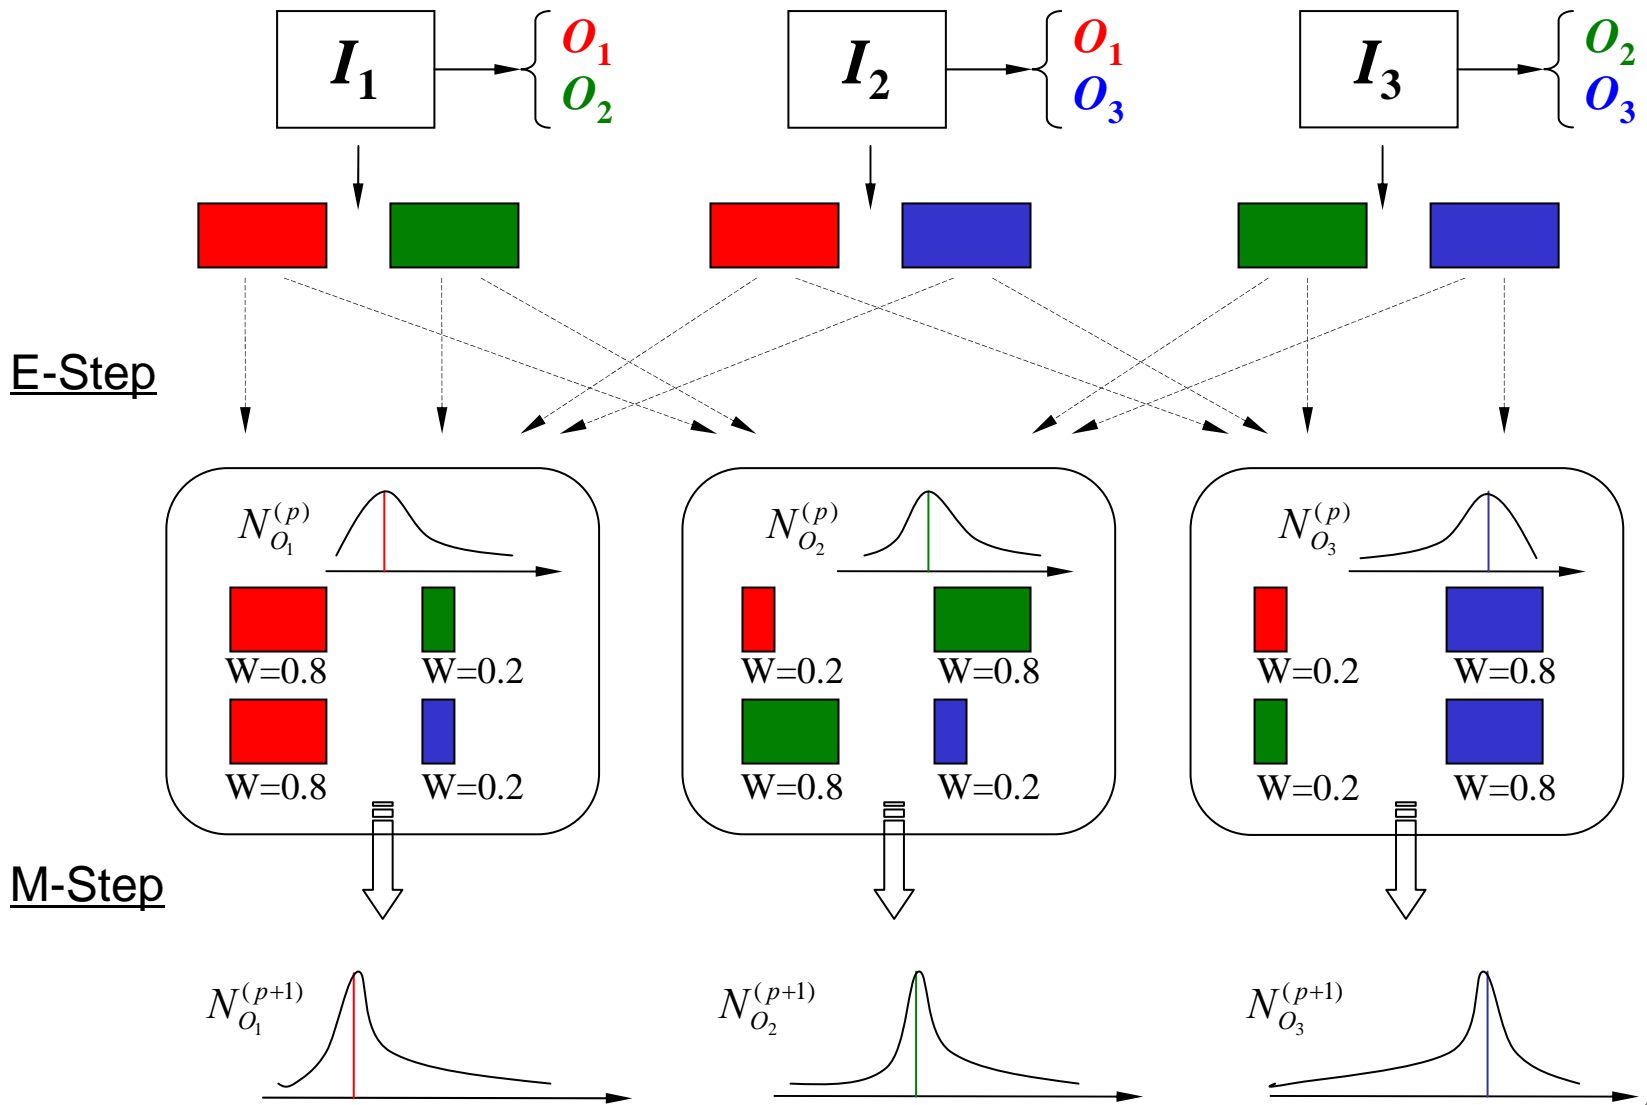

- **Fixed components** corresponding to the given object labels and **fixed component responsibilities** corresponding to the frequencies of the corresponding objects in the training data.
- **Customized initialization** takes advantage of known labels to generate more accurate estimates in the first step.
- **Controlled posterior calculation** ensures that a feature vector only contributes to the Gaussian components representing objects present in its training image.
- **Extra background component** absorbs noise.

1. Initialization Step (Example)

compare

Object Model Database

To calculate $p(\text{tree} | \text{image})$

$$p(\text{tree} | \text{image}) = f \left(\begin{array}{l} p(\text{tree} | \text{blue}) \\ p(\text{tree} | \text{green}) \\ p(\text{tree} | \text{orange}) \\ p(\text{tree} | \text{black}) \end{array} \right)$$

$$p(o | F_I^a) = \int_{r^a \in F_I^a} (p(o | r^a))$$

Combining different abstract regions

- Treat the different types of regions **independently** and combine at the time of classification.

$$p(o | \{F_I^a\}) = \prod_a p(o | F_I^a)$$

- Form **intersections** of the different types of regions, creating smaller regions that have both color and texture properties for classification.

Experiments (on 860 images)

- 18 keywords: **mountains** (30), **orangutan** (37), **track** (40), **tree trunk** (43), **football field** (43), **beach** (45), **prairie grass** (53), **cherry tree** (53), **snow** (54), **zebra** (56), **polar bear** (56), **lion** (71), **water** (76), **chimpanzee** (79), **cheetah** (112), **sky** (259), **grass** (272), **tree** (361).
- A set of cross-validation experiments (80% as training set and the other 20% as test set)
- The poorest results are on object classes "tree," "grass," and "water," each of which has a high variance; a single Gaussian model is insufficient.

Summary

- Designed a set of abstract region features: **color**, **texture**, **structure**, . . .
- Developed a new **semi-supervised EM-like algorithm** to recognize object classes in color photographic images of outdoor scenes; tested on 860 images.
- Compared **two different methods of combining** different types of abstract regions. The intersection method had a higher performance

Our New Approach to Combining Different Feature Types

Phase 1:

- Treat each type of abstract region separately
- For abstract region type a and for object class o , use the EM algorithm to construct a model that is a **mixture of multivariate Gaussians** over the features for type a regions.

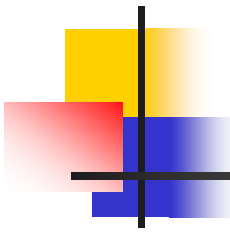

Consider only abstract region type color (c) and object class object (o)

- At the end of Phase 1, we can compute the distribution of color feature vector in an image containing object o .

$$P(X^c|o) = \sum_{m=1}^{M^c} w_m^c \cdot N(X^c; \mu_m^c, \Sigma_m^c)$$

- M^c is the number of components.
- The w 's are the weights of the components.
- The μ 's and Σ 's are the parameters of the components

Now we can determine which components are likely to be present in an image.

- The probability that the feature vector X from color region r of image I_i comes from component m is given by

$$P(X_{i,r}^c, m^c) = w_m^c \cdot N(X_{i,r}^c, \mu_m^c, \Sigma_m^c)$$

- Then the probability that image I_i has a region that comes from component m is

$$P(I_i, m^c) = f(\{P(X_{i,r}^c, m^c) | r = 1, 2, \dots\})$$

- where f is an aggregate function such as **mean** or **max**

Aggregate Scores for Color

Components

1 2 3 4 5 6 7 8

beach

.93	.16	.94	.24	.10	.99	.32	.00
-----	-----	-----	-----	-----	-----	-----	-----

beach

.66	.80	.00	.72	.19	.01	.22	.02
-----	-----	-----	-----	-----	-----	-----	-----

not
beach

.43	.03	.00	.00	.00	.00	.15	.00
-----	-----	-----	-----	-----	-----	-----	-----

We now use **positive** and **negative** training images, calculate for each the probabilities of regions of each component, and form a training matrix.

$$\begin{array}{c} I_1^+ \\ I_2^+ \\ \vdots \\ I_1^- \\ I_2^- \\ \vdots \end{array} \left[\begin{array}{cccc} P(I_1^+, 1^c) & P(I_1^+, 2^c) & \cdots & P(I_1^+, M^c) \\ P(I_2^+, 1^c) & P(I_2^+, 2^c) & \cdots & P(I_2^+, M^c) \\ \vdots & \vdots & & \\ P(I_1^-, 1^c) & P(I_1^-, 2^c) & \cdots & P(I_1^-, M^c) \\ P(I_2^-, 1^c) & P(I_2^-, 2^c) & \cdots & P(I_2^-, M^c) \\ \vdots & \vdots & & \end{array} \right]$$

Phase 2 Learning

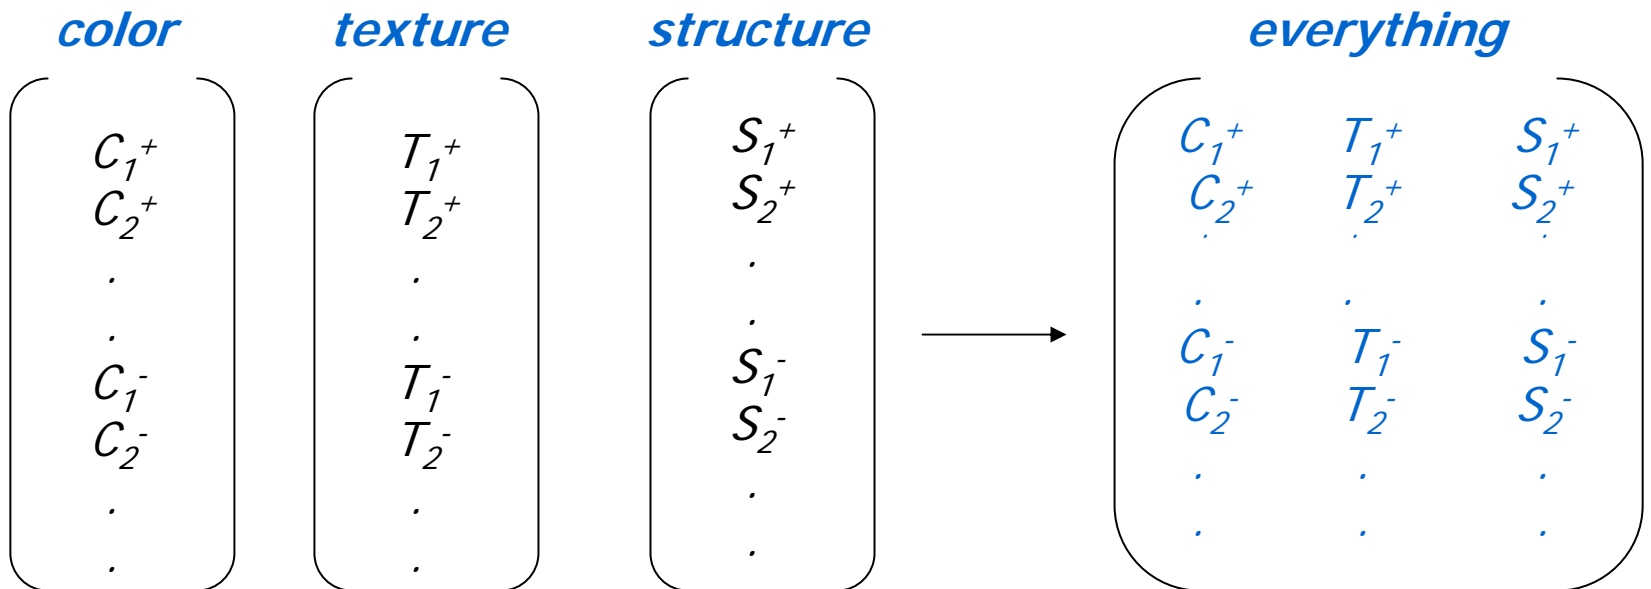

- Let C_i be row i of the training matrix.
- Each such row is a **feature vector** for the color features of regions of image I_i that relates them to the Phase 1 components.
- Now we can use a second-stage classifier to learn $P(o|I_i)$ for each object class o and image I_i .

Multiple Feature Case

- We calculate separate Gaussian mixture models for each different features type:
- Color: C_i
- Texture: T_i
- Structure: S_i
- and any more features we have (motion).

Now we concatenate the matrix rows from the different region types to obtain a **multi-feature-type training matrix**.

Comparison to Fergus and to Dorko/Schmid using their Features

Using their features and image sets, we compared our generative / discriminative approach to those of Fergus and Dorko/Schmid.

The image set contained 1074 airplane images, 826 motor bike images, 450 face images, and 900 background. Half were used to train and half to test. We added half the background images to the training set for our negative examples.

	Fergus	Dorko/Schmid	Ours
airplanes	90.2%	96.0%	96.6%
faces	96.4%	96.8%	96.5%
motorbikes	92.5%	98.0%	99.2%
