

Implementing Table Operations Using Structured Query Language (SQL)

**FIT
100**

The implementation of table operations in relational database management systems is done through use of SQL, or Structured Query Language, the de facto language allowing users to access and manipulate data in RDBM systems.

FIT 100 Remember Operations On Tables

- ❖ The ability to construct tables from other tables.
- ❖ The five basic operations on tables are
 - ❑ Select
 - ❑ Project
 - ❑ Union
 - ❑ Difference
 - ❑ Product
- ❖ Join is a powerful operation created from product/project/select
- ❖ Table operations allow the data to be exhibited to users in whatever form they want

Table AB

StudentID	tbiStudent.LN	tbiStudent.FN	tbiAdvisor.AID	tbiAdvisor.LN	tbiAdvisor.FN
1	Crowley	Caro	2	1 Dickey	Martin
2	Jordan	Michael	1	1 Dickey	Martin
12	Jennings	Waylan	2	1 Dickey	Martin
1	Crowley	Caro	2	2 Whiteaker	Grace
2	Jordan	Michael	1	2 Whiteaker	Grace
12	Jennings	Waylan	2	2 Whiteaker	Grace
1	Crowley	Caro	2	3 Oylar	Mel
2	Jordan	Michael	1	3 Oylar	Mel
12	Jennings	Waylan	2	3 Oylar	Mel
1	Crowley	Caro	2	4 Borning	Alan
2	Jordan	Michael	1	4 Borning	Alan
12	Jennings	Waylan	2	4 Borning	Alan
1	Crowley	Caro	2	5 Cusak	John
2	Jordan	Michael	1	5 Cusak	John
12	Jennings	Waylan	2	5 Cusak	John

Natural Join of Table A and Table B

StudentID	tbiStudent.LN	tbiStudent.FN	AdvisorID	tbiAdvisor.LN	tbiAdvisor.FN
2	Jordan	Michael	1	Dickey	Martin
1	Crowley	Caro	2	Whiteaker	Grace
12	Jennings	Waylan	2	Whiteaker	Grace

Joins between tables reveal stored relationships and provide the data users want to see

FIT 100 Implementing Table Operations With SQL

- ❖ Let's see how various table operations are actually done using a database language
- ❖ SQL stands for Structured Query Language.
- ❖ SQL is the de facto query standard for accessing and manipulating data in relational databases
- ❖ In Access you can also use a graphical query interface, called the QBE (Query By Example), that generates SQL for you

© Copyright 2000-2001, University of Washington

FIT 100 SQL: Structured Query Language

- ❖ There are many uses for SQL in database structures.
 - ❑ SQL can be used to define, or construct, a database
 - ❑ SQL can be used to do basic management of the database
 - + check into table content
 - + add to table content
 - + delete table content
 - + etc.
 - ❑ SQL can be used to query the database
 - + create virtual tables or "views" from existing table(s)
 - + A view may be selected attributes from various tables
- ❖ We will focus on the basic SQL commands that allow us to do simple database management and to create virtual tables (views) of the contents of the database

FIT 100 Queries: Create Tables From Tables

- ❖ **CONCEPT:** The operations on databases: Select, Project, Union, Difference, and Product create tables from tables. These actions are done with a *Query*
- ❖ How are queries implemented?
 - ❑ Database systems come with a "query language" ... SQL is the most common one and is the standard for Relational databases
 - ❑ The most common clauses used in SQL for queries are shown below:

SELECT <fields of desired table> 'what columns will be retrieved
FROM <list of tables> 'which table contains the column data
WHERE <T/F predicate>; 'criteria for returning rows

© Copyright 2000-2001, University of Washington

FIT 100 SQL Syntax

- ❖ SQL is not case sensitive.
- ❖ SQL statements combine several table operations together to display or modify the data
 - ❑ But note the difference between Select and the table operation Selection
 - + The table operation SELECTION brings back rows based on some criteria
 - + Select clause in SQL is actually the Projection table operation

© Copyright 2000-2001, University of Washington

FIT 100 A Simple ERD and Database Schema

- ❖ Advisor and Student tables
 - Each student is allowed a single advisor at any one time
 - An advisor may have zero, one or many students to advise

Advisor	Student
AdvisorID	SID
FName	FName
LName	LName
Department	MajorID
HireDate	AdvisorID
PK AdvisorID	PK SID

© Copyright 2000-2001, University of Washington

FIT 100 Basic Data Management

- ❖ Checking the Tables Contents
 - `SELECT <attributes> FROM <table name(s)>;`
 - Examples:
 - `SELECT * FROM Student;`
- is the same as
 - `SELECT SID, FName, LName, MajorID, AdvisorID FROM Student;`
- ❖ This will essentially mimic the table Student and show all current contents in a view of the table

© Copyright 2000-2001, University of Washington

FIT 100 Queries

- ❖ Partial Listing of Table Contents
 - `SELECT <attributes>`
`FROM <table name(s)>`
`WHERE <T/F predicates>;`
 - Examples:
 - `SELECT FName, LName, Major`
`FROM Student`
`WHERE SID = 0023892;`
 - `SELECT FName, LName`
`FROM Student`
`WHERE Major = "INFO";`

The WHERE clause reduces output of rows based on some specified criteria. An implementation of Selection Operator

© Copyright 2000-2001, University of Washington

FIT 100 NULL Means Nothing

- ❖ A **NULL** character means that nothing has been entered. This is different from a space or a zero.

```
SELECT LName
FROM Student
WHERE FName IS NULL;
```

© Copyright 2000-2001, University of Washington

FIT 100 ORDER BY... Sorting Outputs

- ❖ Sorting in descending order...

```
SELECT StudentID, Name
FROM Student
ORDER BY Name DESC;
```

- ❖ Sorting in ascending order...

```
SELECT StudentID, Name
FROM Student
ORDER BY Name ASC;
```

© Copyright 2000-2001, University of Washington

FIT 100 Preparing for a Join....

- ❖ Example of a Product and Projection Operation:

```
SELECT Student.FName, Student.LName, Advisor.LName
FROM Student, Advisor;
```

- ❖ What is the result?

Notice that I indicate the table name with the attribute when I have more than one table in the FROM statement. Specifically when I have attributes with the same name in different tables. This is called Table Qualification

© Copyright 2000-2001, University of Washington

FIT 100 Queries Using Joins

- ❖ Example of a Join that includes Product, Projection and Selection:

```
SELECT Student.FName, Student.LName, Advisor.LName
FROM Student, Advisor
WHERE Student.AdvisorID = Advisor.AdvisorID;
```

Natural Join using the SQL89 standard

```
SELECT Student.FName, Student.LName, Advisor.LName
FROM Student INNER JOIN Advisor ON
Student.AdvisorID = Advisor.AdvisorID;
```

Natural Join using the SQL92 standard

© Copyright 2000-2001, University of Washington

FIT 100 Comparison Operators

Equals	=
Not equals	<>
Greater than	>
Less than	<
Greater than or equal to	>=
Less than or equal to	<=

© Copyright 2000-2001, University of Washington

FIT 100 Queries

- ❖ Using Relationship Operators for **criteria involving non-key attribute** and/or **criteria involving key attributes**

- Examples:

```
SELECT FName, LName
FROM Advisor
WHERE HireDate >= 1987;
```

```
SELECT FName, LName, Major
FROM Student
WHERE SID < > 0023892;
```

© Copyright 2000-2001, University of Washington

FIT 100 Queries

- ❖ Logical Operators: AND, OR

- Examples:

```
SELECT FName, LName
FROM Advisor
WHERE HireDate > 1987 OR
      HireDate < 1962;
```

```
SELECT FName, LName
FROM Student
WHERE AdvisorID = 44232 AND
      Major = "INFO";
```

© Copyright 2000-2001, University of Washington

FIT 100 Just Scratching the Surface

- ❖ There are many more commands available in SQL as well as different standards for the language
- ❖ You have been shown some common clauses
- ❖ In Access you will be provided with a graphical user interface known as QBE, Query by Example, to create queries. But you can look at [SQL View](#) to see the SQL clauses that are generated
- ❖ Practice interpreting them as a way to see what your query is doing and to be able to explain what the SQL is doing in one of the queries for Project 3, Part II
