## Searching A List: Review

- ▽ If there's no order to the list (or the Yellow Pages)...
  - best you can do is start at the beginning: **linear search**
- ▽ **Binary search** is a simple, common sense way to search through an *ordered* set of items.
  - Questions, often referred to as **queries** or **probes**, are asked to *find if the desired item is smaller or larger*.
  - If the question, hereafter called **probe**, is chosen from the middle of the sequence, ½ the possibilities are eliminated with each answer.
  - It's a bit like 20 questions, but MUCH more specific.

## Binary Search at Work

- ▽ Use binary search to locate **L** in the alphabet  
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z  
After M?

## Another Example of the Algorithm at Work

- ▽ Use binary search to locate a letter in the alphabet  
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z  
After M? **No**  
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z  
After G?

**FIT 100** Another Example of the Algorithm at Work

Use binary search to locate a letter in the alphabet  
 ABCDEFGHIJKLMNOPQRSTUVWXYZ  
 After M? No

ABCDEFGHIJKLM ~~NOPQRSTUVWXYZ~~  
 After G? Yes

~~ABCDEF~~GHIJKLM ~~NOPQRSTUVWXYZ~~  
 After J?

**FIT 100** Another Example of the Algorithm at Work

ABCDEFGHIJKLMN ~~OPQRSTUVWXYZ~~  
 After M? No

ABCDEFGHIJKLM ~~NOPQRSTUVWXYZ~~  
 After G? Yes

~~ABCDEF~~GHIJKLM ~~NOPQRSTUVWXYZ~~  
 After J? Yes

~~ABCDEF~~GHIJK ~~NOPQRSTUVWXYZ~~  
 After L? No

~~ABCDEF~~GHIJKL ~~NOPQRSTUVWXYZ~~  
 After K? Yes  The Letter is L PTopics-8

## **FIT 100** How Good is a Particular Algorithm?

- v You might think we can't answer this question without programming a computer and trying it.
- v Amazingly, it is possible to make very good comparisons between algorithms without programming them!
- v Basic idea: estimate the number of "steps" each algorithm needs to solve the problems.
- v Computers run at different speeds, but..
  - o they are all alike enough that the number of steps they need for a particular algorithm doesn't vary by as much as you might think.
- v This gives us an abstract, mathematical way to compare the speed of different algorithms

## **FIT 100** Algorithm vs. Program

- v Remember that an **algorithm** is an abstraction.
- v We can apply it, at least mentally, to a variety of situations, even without a computer
- v A **program** incorporates all the details needed for a computer to perform the algorithm
- v A **program** for binary search will encode the algorithm for a specific situation, in a specific language, with specific assumptions

## **FIT 100** Battle of the Algorithms

- v **Binary Search**: Each question allows you to throw out half of the unexamined items (throw half of the phone book away each time)
- v **Linear Search**: Each question lets you tear out only one page.

## **FIT 100** Do The Math for Searching 200 Items

	linear	binary
step 0	200 remaining	200
step 1	199	100
step 2	198	50
step 3 see where it's going?	197	25

**FIT  
100**

## Bottom Line

- v It can be shown mathematically when a sorted list of  $N$  items is to be searched:
- v **Linear sort** needs on average about  $N/2$  steps
- v **Binary sort** needs on average about  $\text{Log}_2 N$  steps
- v The bigger  $N$  is, the bigger the improvement.
- v Project for someone: Calculate and present some numbers based on these formulas (see me).

**FIT  
100**

## Trade-Offs

- v If we know algorithm A has a better formula than algorithm B:

*Would we ever still want to use algorithm B??*

## Procedures: Review

- v Procedures (also known as `___`, `___`, `___` etc.) are sets of statements that accomplish some purpose.
- v Procedures “encapsulate functionality” (package together useful operations, algorithms) so that they can be used anytime needed.
- v For example, you only write the `cmdOK-Click` function once, but it executes many times – each time there is a click on that button.

## Procedure Terminology

```
Private Sub txtScoops_KeyPress (KeyAscii as Integer)
    lblScoops.Caption = txtScoops.text & " scoops, please."
    tstScoops.text = ""
End Sub
```

Procedures have the following features:

- o **Name:** term used to refer to the task the procedure performs,
- o **Definition:** The steps that will accomplish the task. Also known as the *procedure body*
- o **Parameters:** the names of the data sent to or from the procedure
- o **Declaration:** the entire package of the name, definition and parameters

## Calling A Procedure

- ∇ The procedure declaration only specifies **how** the procedure works and only needs to be given once
- ∇ A **procedure call** causes the procedure to execute.
- ∇ A procedure call can be used anywhere that the task to be performed is needed

Example: The system “calls” cmdOK\_Click automatically  
Surprise: you could call that event handler yourself if you wanted to

Why might you want to?

How would you do it?

**FIT  
100**

## Procedural Abstraction

- ∇ Whenever the same operations are performed in different places in a program, there is an opportunity for “procedural abstraction”: wrapping the operations into a procedure.

*Private Sub anynameIchoose( )*

*'any statements I want*

*'as many as I want*

*End Sub*

- ∇ You can then call the function from different parts of the program.

## Mini-Exercise #1

- ∇ What is the value of x after the form has been loaded?

```
Option Explicit  
Dim x As Integer
```

```
Private Sub squid()  
x=x+2  
End Sub
```

```
Private Sub Form_Load  
x=0  
Call squid  
End Sub
```

**FIT  
100**

## Mini-Exercise #2

- ∇ What is the value of y after the form has been loaded?

```
Option Explicit  
Dim y As Integer
```

```
Private Sub squid()  
y=y+2  
End Sub
```

```
Private Sub clam()  
call squid  
call squid  
End Sub
```

```
Private Sub Form_Load  
y=0  
Call squid  
Call clam  
End Sub
```

## Collections: Review

---

- ▽ Let's make an appointment book.
- ▽ Declare it.
- ▽ Give it some initial dates.
- ▽ Display all the dates.
- ▽ Display a particular date.
- ▽ Add a date and display again

## Getting Each Character From A String

---

```
Dim count as Integer
Dim i as Integer
For i = 0 to count
    MsgBox (Mid("Gong Xi Fa Cai", 2, 4))
next i
```
