How can we manage lists of objects?

- We'd like to be able to ...
 - » add things to the list
 - » look at the elements of the list one by one
 - » find out how many things have been put in the list
 - » remove things from the list
 - » ... among other things

Collections in the Real World

- Think about:
 - » words in a dictionary
 - » list of pets in your household
 - » deck of cards
 - » books in a library
 - » songs on a CD
 - » controls in an HTML form
- These things are all *collections* of objects

iCCC example

- Consider the iCCC example program
 - » There are 4 radio buttons for shot count, 3 radio buttons for cup size, and 4 radio buttons for drink
 - » We could give each radio button an `id` and check it individually to see if it is currently selected
 - » But it's much cleaner to treat the buttons in each group the same way, and just look at them in turn
- Looping over the elements of a group is often simpler and more flexible than treating them individually

4

```

for (var i=0; i<document.getElementById("shotForm").elements.length; i++) {
    element = document.getElementById("shotForm").elements[i];
    if (element.checked) {
        shotCount = parseInt(element.value,10);
    }
}

```

Array Example

```

<head>
<title>Arrays example</title>
<script type="text/javascript">
var petNames = new Array();
petNames[0] = "Jaba";
petNames[1] = "Bingo";
petNames[2] = "Jessica";
petNames[3] = "Sumi";
petNames[4] = "Jennifer";
</script>
</head>

```

create the array

store a reference to the array in variable petNames

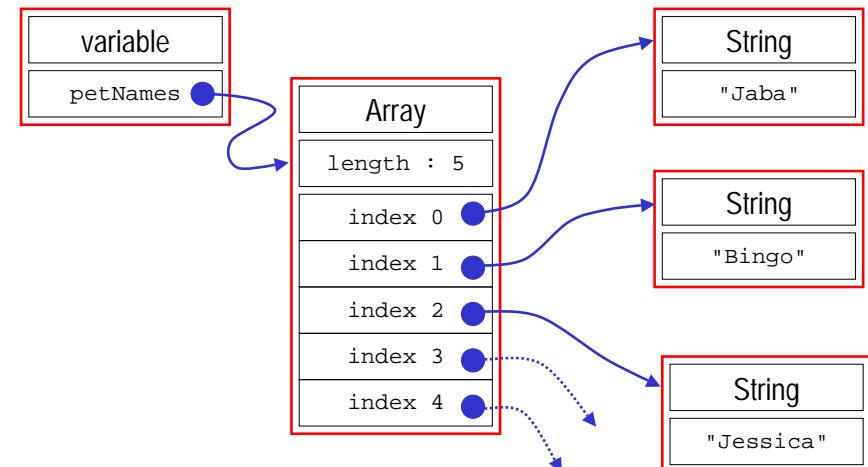

add new entries to the array

Arrays

- JavaScript (and most other languages) includes *arrays* as the most basic kind of collection.
 - » Simple, ordered collections
 - » Special syntax for accessing elements by position
- JavaScript arrays can be created
 - » by the programmer in the script
 - » by the system and provided to the script
 - for example, the elements array in the iCCC program

Array Example

JavaScript Indexed Arrays

- An indexed array is a data type that stores a collection of values, accessible by number
 - » the values in the array are called the *elements* of the array
 - » the elements (or values) are accessed by *index*
 - the index of the first value is 0
 - » the values in the array can be any type
 - usually all the values are the same type
 - but they can be different from one another if necessary

Array Element Access

- Access an array element using the array name and position: *<array name> [<position>]*
- Details:
 - » *<position>* is an integer expression.
 - » Positions count from zero
- Update an array element by assigning to it:
<array name> [<position>] = <new element value> ;

Array Declaration and Creation

- Arrays can be created several different ways
 - » **var petNames = new Array();**
 - 0-length array with no elements in it yet
 - » **var studentNames = new Array(102);**
 - 102-element array, all of which have the value *undefined*
 - » **var myList = ["Sally", "Splat", "Google"];**
 - 3-element array initialized with an *array literal*
- Arrays have a property that stores the length
<array name>.length
 - » you can lengthen or shorten an array by setting the length to a new value

```
<html>
<head>
<title>Arrays Example B</title>
<script type="text/javascript">
var petNames = new Array();
var studentNames = new Array(102);
var myList = ["Sally", "Splat", "Google"];
</script>
</head>

<body>
<script type="text/javascript">
document.write("<br>petNames has "+petNames.length+" elements.");
document.write("<br><br>studentNames has "+studentNames.length+" elements.");
if (studentNames.length > 0) {
    document.write("<br>The first student name is "+studentNames[0]+".");
}
document.write("<br><br>myList has "+myList.length+" elements.");
if (myList.length > 0) {
    document.write("<br>"+myList.join(", ")+".");
}
</script>
</body>
</html>
```

Looping Over Array Contents

- The length attribute makes it easy to loop over all the elements of an Array:

```
document.write("<br>Unsorted list of pet names.<br>");
for (var i=0; i<petNames.length; i++) {
  if (i != 0) {
    document.write(", ");
  }
  document.write(petNames[i]);
}
```

13

```
<body>
<script type="text/javascript">
// 2-element array literal
var names = ["alex","brenda"];
document.write("length: "+names.length);
// extend it to 4 elements
names.length = 4;
document.write("<br><br>length: "+names.length);
for (var i = 0; i<names.length; i++) {
  document.write("<br>"+names[i]);
}
// delete, assign, and shorten
delete names[0];
names[2] = "carrie";
names.length = 3;
document.write("<br><br>length: "+names.length);
for (var i = 0; i<names.length; i++) {
  document.write("<br>"+names[i]);
}
</script>
</body>
```

arraysC.html

deleting elements

- Change the length property to change the number of elements in the array
 - » `names.length = 4;`
- Use the delete operator to set a particular entry to the value undefined
 - » `delete names[0];`

interesting functions

- There are several predefined functions available for working with arrays
 - » `join()` ← join all the elements in one long string
 - » `reverse()` ← reverse the order of the elements
 - » `sort()` ← sort the elements in the array
 - » `concat(...)` ← add elements to the array
 - » etc

```
document.write("<br><br>Sorted list of pet names.<br>");
petNames.sort();
...
```

Array Summary

- Arrays are a collection data type built in to the JavaScript language.
 - » Also found in essentially all programming languages
- Indexed access to elements
 - » remember, it's 0-based, the first element is element 0
- Elements can be added to an array by specifying the index value in the assignment statement

```
petNames[5] = "Eleanor";
```
- There are useful functions available for manipulating arrays
