

Drawing pictures ... It's not art, it's fun

Basic Processing ...

Lawrence Snyder
University of Washington, Seattle

Processing ...

- It's our main programming language
- "Processing" is kind of a dumb name,* but it is a good (and fun) language
- It's a language for programming graphical and image-based computations
 - More fun than programming an operating system
 - Easier to do because we "see" what's happening
 - It's real – fun now, great prep for future

* Really really dumb, actually

Short Interrupt: Grab Processing

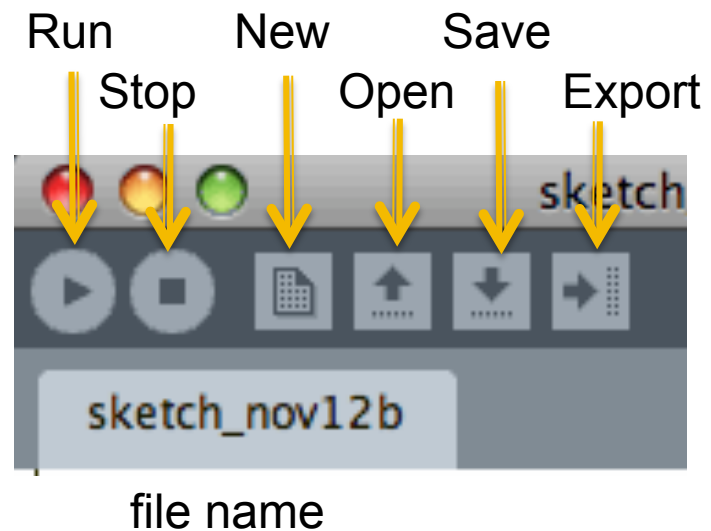

- If you have a personal computer that is convenient to do homework on, then grab a copy of the Processing system and put it on your machine ... improve your convenience!
- Grab it at: <http://processing.org/download/>
- You will want “Windows” or “Mac” versions
- Following installation instructions ... it takes less than 5 minutes and then you can work on your own computer!

What You See

- When you start up the Processing system...

programming window

Add Some Code

- Type in instructions that you will learn shortly
Then run your program

```
sketch_130110a | Processing 2.0b
sketch_130110a §
// Draw a snow angel on blue snow

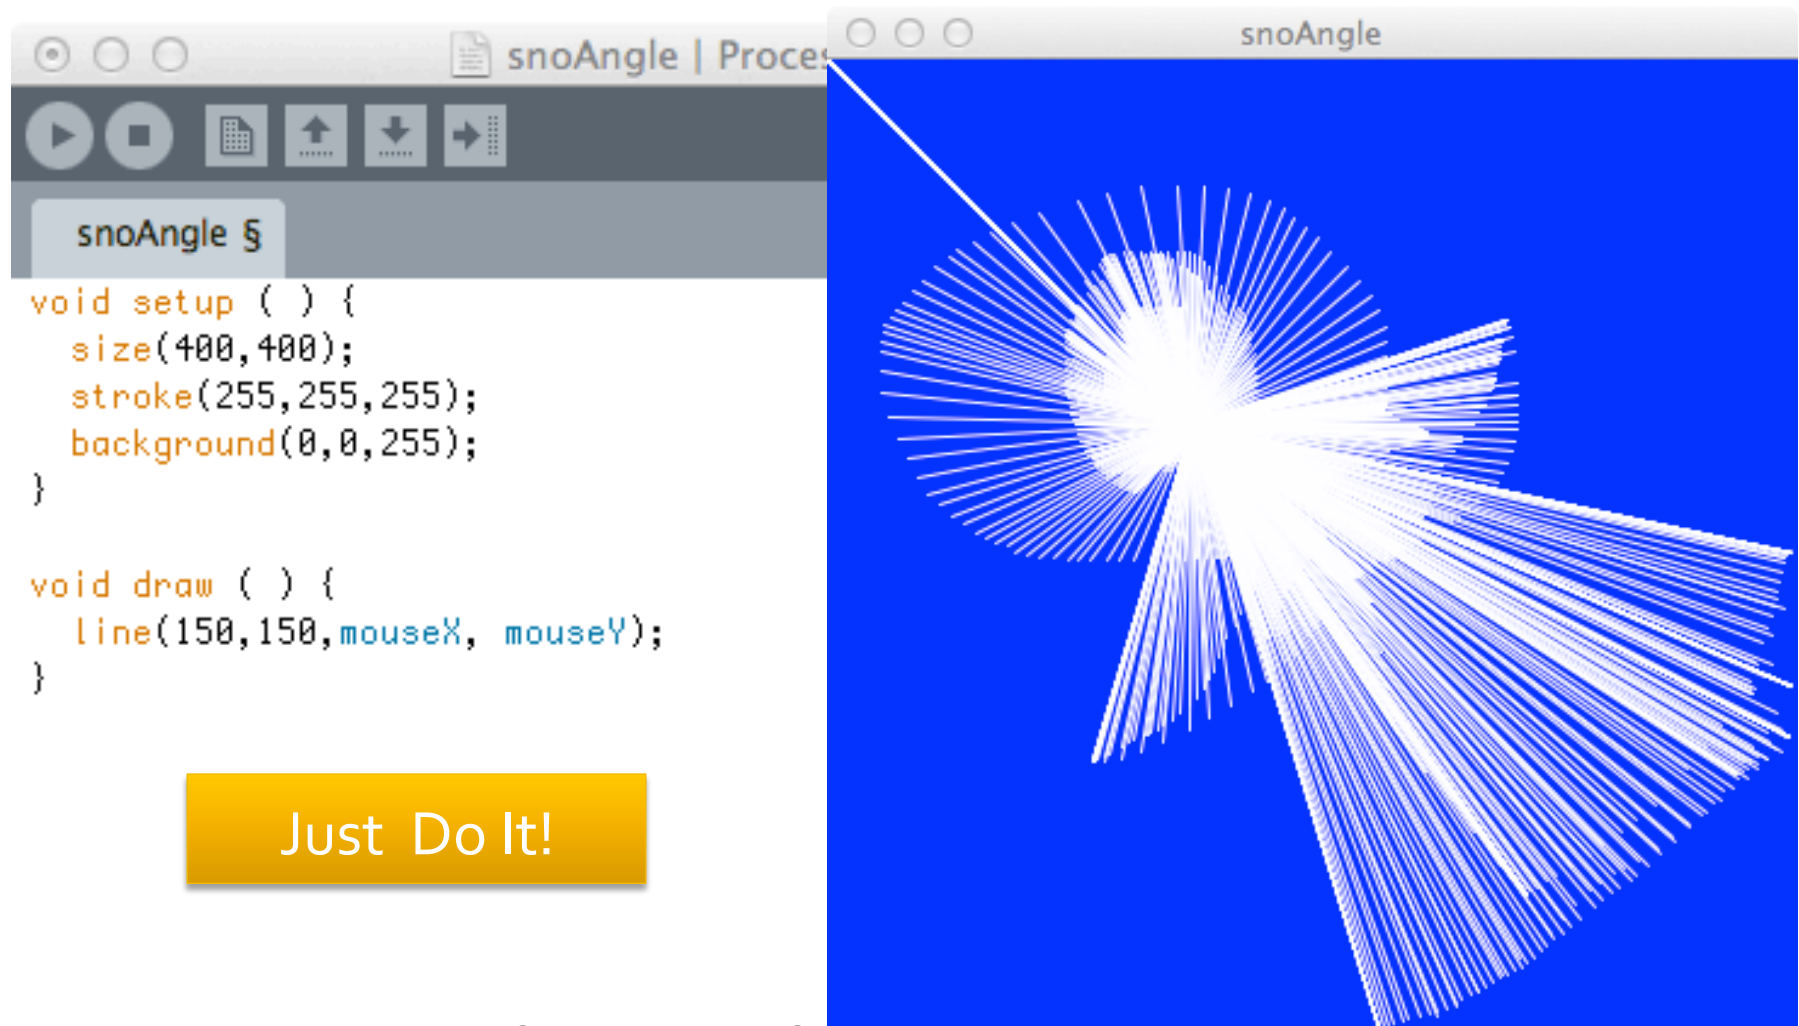

void setup() {
  size(500,500);      //define canvas size
  background(0,0,255); //define canvas color
  stroke(0,0,255);    //define line color
}

void draw() {
  line(150,150, mouseX, mouseY); //draw line from
  if (mousePressed){ //if the mouse is ever cl
    stroke(255);
  }
}
```

Looking At Simpler Code

- Drawing a snow angel is straightforward ...

The image shows a screenshot of a Processing IDE window titled "snoAngle | Process" and a corresponding window titled "snoAngle". The IDE window displays the following code:

```
void setup ( ) {  
  size(400,400);  
  stroke(255,255,255);  
  background(0,0,255);  
}  
  
void draw ( ) {  
  line(150,150,mouseX, mouseY);  
}
```

The "snoAngle" window displays a blue background with a white snow angel shape drawn on it. The snow angel is composed of many thin white lines radiating from a central point (150, 150) to the mouse cursor. The IDE window also shows a toolbar with various icons and a tab labeled "snoAngle §".

Just Do It!

Coding Is ALL Detail

■ Notice everything!

```
void setup( ) {  
    size(500,500);  
    stroke(0,0,255);  
    background(255);  
}
```

```
void draw() {  
    line(100,100, mouseX, mouseY);  
}
```

- ◆ Keywords are highlighted in blue
- ◆ Processing is case sensitive; notice!

- ◆ Two Functions, One Common Form:

```
void <name> ( ) {  
    all symbols +  
    placement matter  
}
```

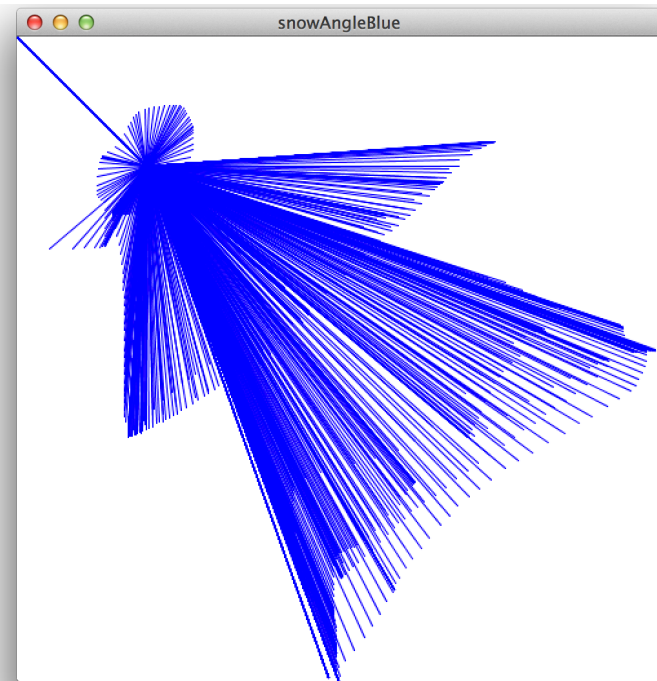

- ◆ Every statement ends with a semicolon (;)
- ◆ The software colors text it understands – helpful
- ◆ Some functions include stuff inside parentheses; these are called *arguments*
- ◆ If a function has arguments, each position has a specific meaning: **size**(<width>, <height>);
stroke(<red value>, <green value>, <blue value>);
- ◆ If your cursor is by a closing parenthesis or brace, the matching parenthesis or brace is highlighted

The Color Purple

- Colors in most Web programming are given as three values in $[0, 255]$: **RGB**, for red, green, blue
- The Color Purple, for example, is: **128,0,128**
- These positions are the intensity of the little lights that make up a pixel on the screen
 - The least intensity is 0, that is, off
 - The greatest intensity is 255, maximum brightness
 - Amazingly, the three max RGB colors make **white**
 - So, purple is $\frac{1}{2}$ intensity of **R**ed, no **G**reen, and $\frac{1}{2}$ intensity of **B**lue ... makes sense

Questions about “Angelic Huskies”

- The angel is blue on a white background specified by: `background(255, 255, 255); ...` which means?
- Stroke sets line color: `stroke(0, 0, 255);`
- Suppose it's a Husky angel on white snow:
- Stroke sets object's color: `stroke(128, 0, 128);`

It's All The Same

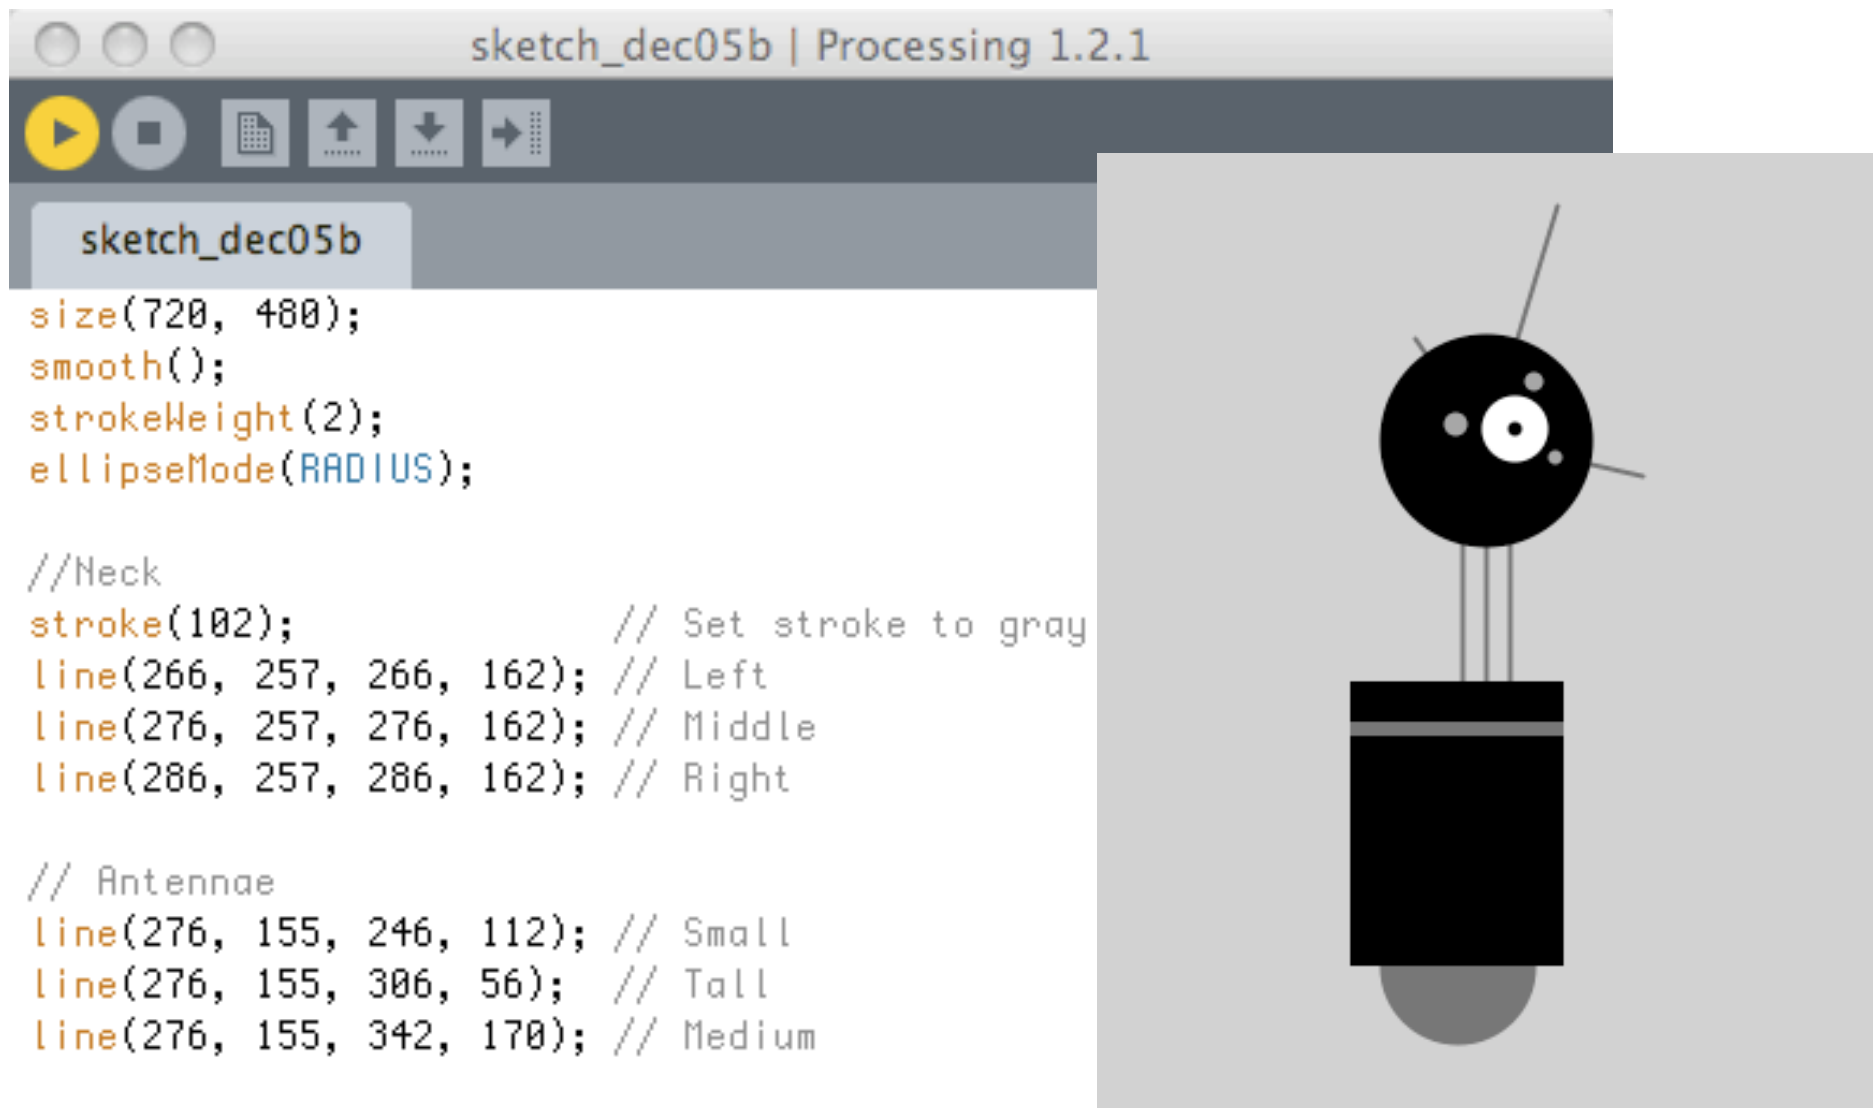

- When the values for RGB are all the same, it's some color of gray, or white, or black
- Since writing `background(255, 255, 255)` is kind of a drag, Processing allows us to give just one argument; so `background(255)` is equivalent to giving all three 255s
- What colors are these backgrounds?
 - `background(255, 0, 0);`
 - `background(64);`
 - `background(0, 0, 64);`

Simple Shapes Make Robots

- Reas and Fry, in their book, show us a cute robot they programmed using simple shapes
- They give their code and we can see how they built it
- To make the point that **all code must “make sense”** – its not gibberish – lets look at it even though we don't know Processing yet

Robot Code, 1

The image shows a screenshot of a Processing IDE window titled "sketch_dec05b | Processing 1.2.1". The window contains a code editor on the left and a preview window on the right. The code in the editor is as follows:

```
size(720, 480);
smooth();
strokeWeight(2);
ellipseMode(RADIUS);

//Neck
stroke(102);           // Set stroke to gray
line(266, 257, 266, 162); // Left
line(276, 257, 276, 162); // Middle
line(286, 257, 286, 162); // Right

// Antennae
line(276, 155, 246, 112); // Small
line(276, 155, 306, 56);  // Tall
line(276, 155, 342, 170); // Medium
```

The preview window on the right shows a stylized robot. The robot has a black circular head with a white eye and two small white dots. It has three thin gray lines for antennae extending from the top of the head. The neck is composed of three vertical gray lines. The body is a black rectangle with a thin white horizontal line near the top. The robot is standing on a gray semi-circular base.

Robot Code, 2

```
// Body
noStroke();           // Diabile stroke
fill(102);           // Set to gray
ellipse(264, 377, 33, 33); // Antigravity Orb
fill(0);             // Set to black
rect(219, 257, 90, 120); // Main body
fill(102);           // Set back to gray
rect(219, 274, 90, 6); // Gray stripe

// Head
fill(0);             // Set to black
ellipse(276, 155, 45, 45); // Head
fill(255);           // Set to white
ellipse(288, 150, 14, 14); // Large eye
fill(0);             // Set to black
ellipse(288, 150, 3, 3); // Pupil
fill(153);           // Set to gray
ellipse(263, 148, 5, 5); // Small eye 1
ellipse(296, 130, 4, 4); // Small eye 2
ellipse(305, 162, 3, 3); // Small eye 3
```

Knowing Only About Color ...

- We “improve” the robot by adding some color

Just Do It!
