

CSE 311: Foundations of Computing

Lecture 21: Directed Graphs, Finite State Machines

COM² BBQ This
Friday afternoon

Last time: Relations

Let A and B be sets,

A **binary relation from A to B** is a subset of $A \times B$

$$R \subseteq A \times B$$

Let A be a set,

A **binary relation on A** is a subset of $A \times A$

$$R \subseteq A \times A$$

Last time: Properties of Relations

Let R be a relation on A .

R is **reflexive** iff $(a,a) \in R$ for every $a \in A$

R is **symmetric** iff $(a,b) \in R$ implies $(b,a) \in R$

R is **antisymmetric** iff $(a,b) \in R$ and $a \neq b$ implies $(b,a) \notin R$

R is **transitive** iff $(a,b) \in R$ and $(b,c) \in R$ implies $(a,c) \in R$

Functions

A function $f : A \rightarrow B$ (A as input and B as output) is a special type of relation.

A function f from A to B is a relation from A to B such that:
for every $a \in A$, there is *exactly one* $b \in B$ with $(a, b) \in f$

i.e., for every input $a \in A$, there is one output $b \in B$.
We denote this b by $f(a)$.

Function composition: If $f : A \rightarrow B$ and $g : B \rightarrow C$ then their composition $g \circ f : A \rightarrow C$ is defined by

$$(g \circ f)(a) = g(f(a))$$

Composing Relations

Let R be a relation from A to B .

Let S be a relation from B to C .

The **composition** of R and S , $S \circ R$ is the relation from A to C defined by:

$$S \circ R = \{(a, c) : \exists b \text{ such that } (a, b) \in R \text{ and } (b, c) \in S\}$$

Intuitively, a pair is in the composition if there is a “connection” from the first to the second.

The order of writing composition generalizes the function case

Examples

$(a,b) \in \text{Parent}$ iff b is a parent of a

$(a,b) \in \text{Sister}$ iff b is a sister of a

When is $(x,y) \in \text{Sister} \circ \text{Parent}$?

y is Aunt of ~~x~~

When is $(x,y) \in \text{Parent} \circ \text{Sister}$?

*$(x,y) \in \text{Parent}$? \wedge ~~has~~ has sister(x)
?*

$$S \circ R = \{(a, c) \mid \exists b \text{ such that } (a,b) \in R \text{ and } (b,c) \in S\}$$

Powers of a Relation

$$R^2 = R \circ R \\ = \{ (a, c) : \exists b \text{ such that } (a, b) \in R \text{ and } (b, c) \in R \}$$

$$R^0 = \{ (a, a) : a \in A \} \quad \text{“the equality relation on } A \text{”}$$

$$R^{n+1} = R^n \circ R \quad \text{for } n \geq 0$$

$$\text{e.g., } R^1 = R^0 \circ R = R \\ R^2 = R^1 \circ R = R \circ R$$

Matrix Representation

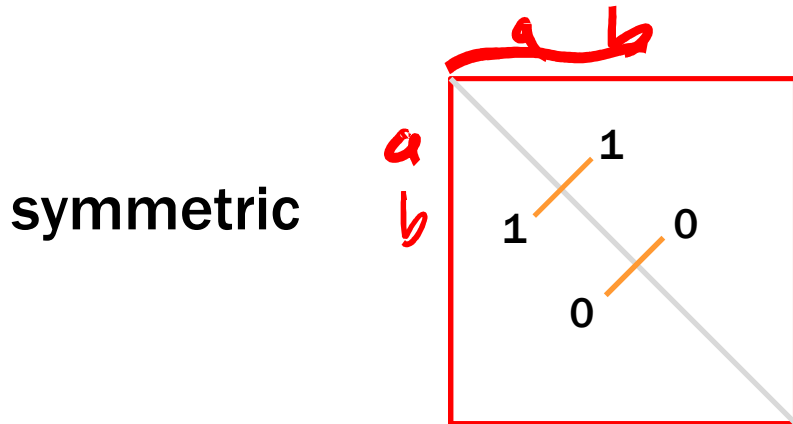

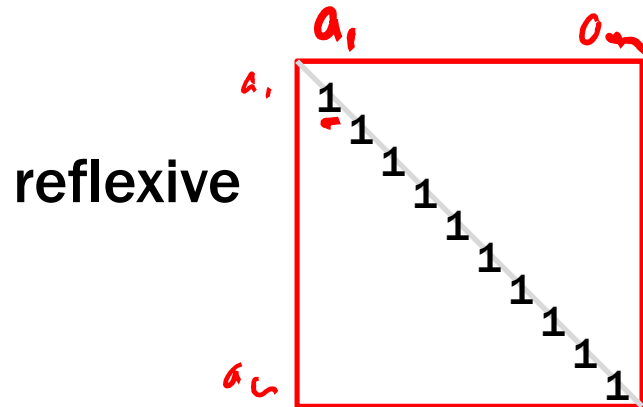

Relation R on $A = \{a_1, \dots, a_n\}$

$$m_{ij} = \begin{cases} 1 & \text{if } (a_i, a_j) \in R \\ 0 & \text{if } (a_i, a_j) \notin R \end{cases}$$

$\{(1, 1), (1, 2), (1, 4), (2, 1), (2, 3), (3, 2), (3, 3), (4, 2), (4, 3)\}$

	1	2	3	4
1	1	1	0	1
2	1	0	1	0
3	0	1	1	0
4	0	1	1	0

Properties using matrix representation

swapped

anti-symmetric

No 1-1 pairs

Directed Graphs

$G = (V, E)$

V – vertices

E – edges, ordered pairs of vertices

$E \subseteq V \times V$

Directed Graphs

$G = (V, E)$

V – vertices

E – edges

(relation on vertices)

Path: v_0, v_1, \dots, v_k with each (v_i, v_{i+1}) in E

Directed Graphs

$G = (V, E)$ V – vertices
 E – edges (relation on vertices)

Path: v_0, v_1, \dots, v_k with each (v_i, v_{i+1}) in E

Simple Path: none of v_0, \dots, v_k repeated

Cycle: $v_0 = v_k$

Simple Cycle: $v_0 = v_k$, none of v_1, \dots, v_k repeated

Directed Graphs

$G = (V, E)$ V – vertices
 E – edges (relation on vertices)

Path: v_0, v_1, \dots, v_k with each (v_i, v_{i+1}) in E

Simple Path: none of v_0, \dots, v_k repeated

Cycle: $v_0 = v_k$

Simple Cycle: $v_0 = v_k$, none of v_1, \dots, v_k repeated

Directed Graphs

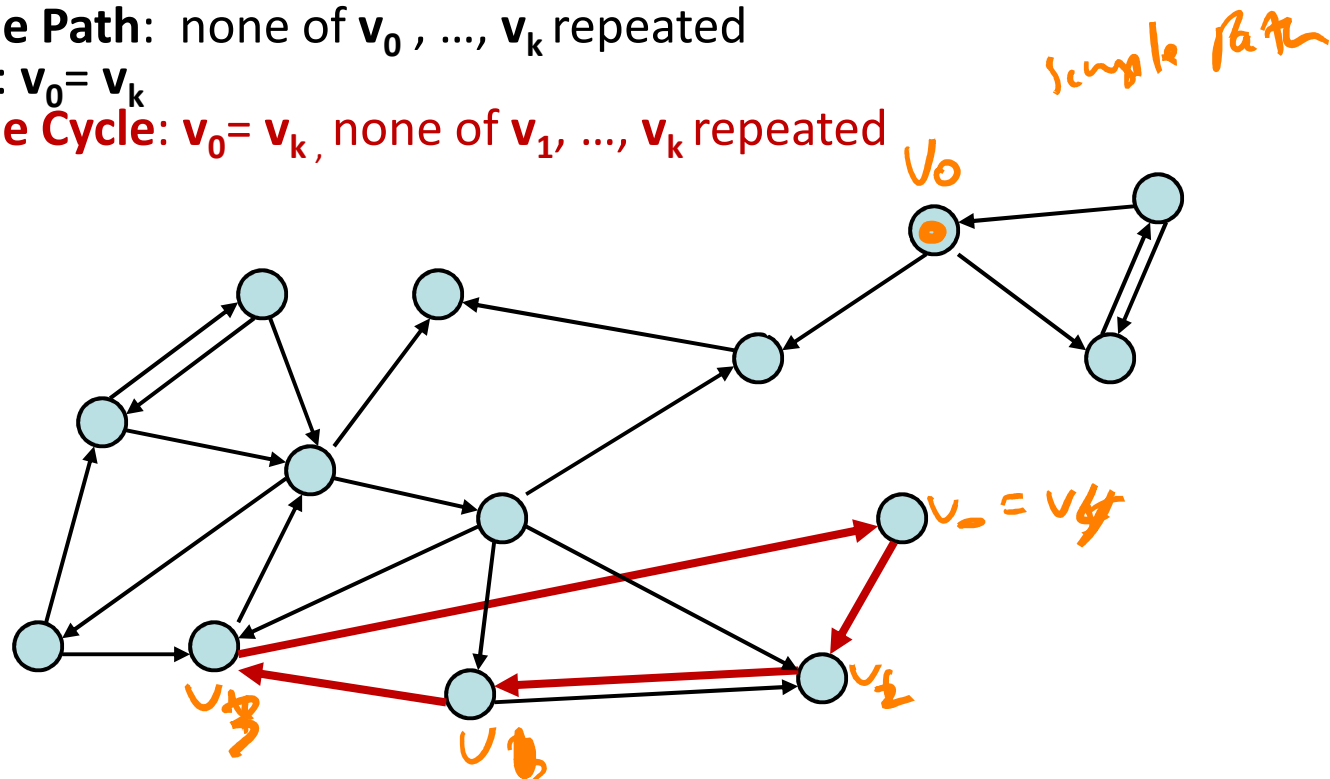

$G = (V, E)$ V – vertices
 E – edges (relation on vertices)

Path: v_0, v_1, \dots, v_k with each (v_i, v_{i+1}) in E

Simple Path: none of v_0, \dots, v_k repeated

Cycle: $v_0 = v_k$

Simple Cycle: $v_0 = v_k$, none of v_1, \dots, v_k repeated

Representation of Relations

Directed Graph Representation (Digraph)

{(a, b), (a, a), (b, a), (c, a), (c, d), (c, e) (d, e) }

$V_0 = a$
 $V_0 = a \quad V_1 = a$
 $V_0 = a \quad V_1 = a$
 $V_2 = a$
not sample

Representation of Relations

Directed Graph Representation (Digraph)

$\{(a, b), (a, a), (b, a), (c, a), (c, d), (c, e), (d, e)\}$

Relational Composition using Digraphs

If $S = \{(2, 2), (2, 3), (3, 1)\}$ and $R = \{(1, 2), (2, 1), (1, 3)\}$

Compute $S \circ R$

Relational Composition using Digraphs

If $S = \{(2, 2), (2, 3), (3, 1)\}$ and $R = \{(1, 2), (2, 1), (1, 3)\}$

Compute $S \circ R$

Relational Composition using Digraphs

If $S = \{(2, 2), (2, 3), (3, 1)\}$ and $R = \{(1, 2), (2, 1), (1, 3)\}$

Compute $S \circ R$

Relational Composition using Digraphs

If $R = \{(1, 2), (2, 1), (1, 3)\}$ and $R = \{(1, 2), (2, 1), (1, 3)\}$

Compute $R \circ R$

$(1, 2), (2, 1)$

$(2, 1), (1, 2)$

$(a, c) \in R \circ R = R^2$ iff $\exists b ((a, b) \in R \wedge (b, c) \in R)$
 iff $\exists b$ such that a, b, c is a path

Relational Composition using Digraphs

If $R = \{(1, 2), (2, 1), (1, 3)\}$ and $R = \{(1, 2), (2, 1), (1, 3)\}$

Compute $R \circ R$

Special case: $R \circ R$ is paths of length 2.

- R is paths of length 1
- R^0 is paths of length 0 (can't go anywhere)
- $R^3 = R^2 \circ R$ etc, so is R^n paths of length n

Paths in Graphs and Relations

Def: The **length** of a path in a graph is the number of edges in it (counting repetitions if edge used $>$ once).

Elements of R^0 correspond to paths of length 0.

Elements of $R^1 = R$ are paths of length 1.

Elements of R^2 are paths of length 2.

...

Paths in Graphs and Relations

Def: The **length** of a path in a graph is the number of edges in it (counting repetitions if edge used $>$ once).

Let R be a relation on a set A .

There is a path of length n from a to b in the digraph for R if and only if $(a,b) \in R^n$

Connectivity In Graphs

v.

Def: Two vertices in a graph are connected iff there is a path between them.

Let R be a relation on a set A . The **connectivity** relation R^* consists of the pairs (a, b) such that there is a path from a to b in R .

$$R^* = \bigcup_{k=0}^{\infty} R^k$$

$$R^* = \bigcup_{n=0}^{\infty} R^n = R^0 \cup R^1 \cup R^2 \cup \dots \cup R^n \cup \dots$$

Note: The Rosen book uses the wrong definition of this quantity. What the Rosen defines (ignoring $k = 0$) is usually called R^+

How Properties of Relations show up in Graphs

Let R be a relation on A .

R is **reflexive** iff $(a,a) \in R$ for every $a \in A$

R is **symmetric** iff $(a,b) \in R$ implies $(b,a) \in R$

R is **antisymmetric** iff $(a,b) \in R$ and $a \neq b$ implies $(b,a) \notin R$

R is **transitive** iff $(a,b) \in R$ and $(b,c) \in R$ implies $(a,c) \in R$

How Properties of Relations show up in Graphs

Let R be a relation on A .

R is **reflexive** iff $(a,a) \in R$ for every $a \in A$

R is **symmetric** iff $(a,b) \in R$ implies $(b,a) \in R$

R is **antisymmetric** iff $(a,b) \in R$ and $a \neq b$ implies $(b,a) \notin R$

R is **transitive** iff $(a,b) \in R$ and $(b,c) \in R$ implies $(a,c) \in R$

Transitive-Reflexive Closure

Add the **minimum possible** number of edges to make the relation transitive and reflexive.

Transitive-Reflexive Closure

Relation with the **minimum possible** number of **extra edges** to make the relation both transitive and reflexive.

The **transitive-reflexive closure** of a relation R is the connectivity relation R^*

n-ary Relations

Let A_1, A_2, \dots, A_n be sets. An ***n*-ary** relation on these sets is a subset of $A_1 \times A_2 \times \dots \times A_n$.
