

19—String Compression

May 29, 2002

File	Size (bytes)
maze.ps	1746364
maze.ps.gz	37143
maze.ps.bz2	14039

1

Two Kinds of Compression

Lossy Compression

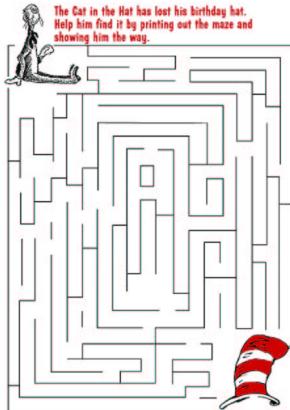

- Good for
 - Images
 - Sound
- jpeg, mpeg, mp3

Lossless Compression

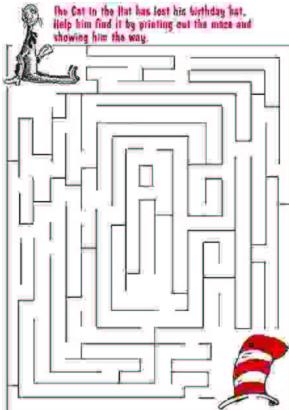

- Good for
 - Documents
 - Binaries
- zip, gz, Z, bz2

2

— Lossy Compression —

Original Image (20763 bytes)

Highly Compressed (14763 bytes)

— Lossless String Compression —

- How many bits does this string take up in C++?

7108324569

- Can we do better?

— A Generalization —

7108324569

- *Alphabet* Σ of string has 10 characters
- Need $\lceil \log_2 |\Sigma| \rceil = 4$ bits per character

— Lossless String Compression —

- How many bits does this string take up in C++?

1111111897

- How many bits if we encode in 4 bits?
- Can we do better?

UW CSE326 Sp '02: 19—Compression 6

— Compressing Text —

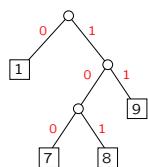

Letter	Freq
a	9
b	1
c	4
d	8
e	23
f	3
g	2
h	7
i	13
j	4
m	5
n	9
o	12
p	6
r	13
s	14
t	17
u	3
v	1
w	3
x	1
y	4
z	0

See the pictures in the sorting slides.
The last few iterations of Radix sort can
probe memory in a very random way, as
it depends on the upper digits of the
sorted items, which are completely
unsorted.

Why encode *x* the same size as *e*?

UW CSE326 Sp '02: 19—Compression 7

— Encoding Trees —

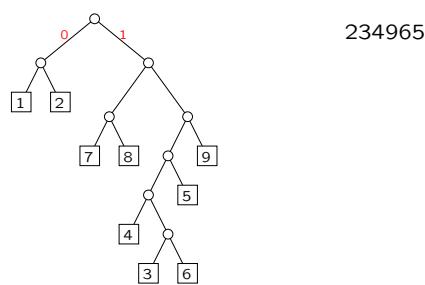

- All characters are *leaves*
- Encoding of *c* found from path to *c*

1111111897 = 0000000 10111100

UW CSE326 Sp '02: 19—Compression 8

— Example —

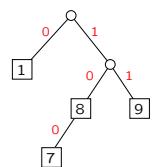

234965

UW CSE326 Sp '02: 19—Compression

9

— What's Wrong with this Tree? —

1111111897 = 000000010111100

UW CSE326 Sp '02: 19—Compression

10

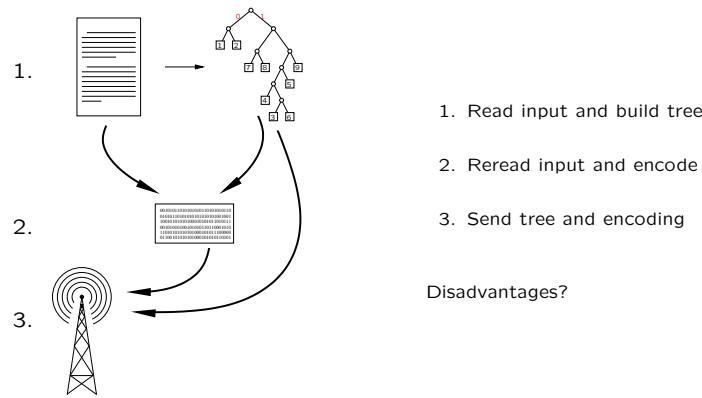

— How to Encode —

Letter	Freq
1	7
7	1
8	1
9	1

UW CSE326 Sp '02: 19—Compression

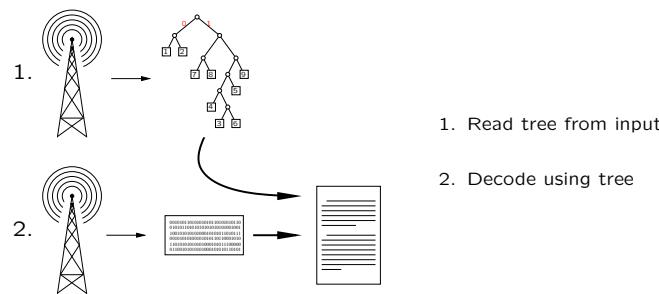

11

Two-Pass Encoding

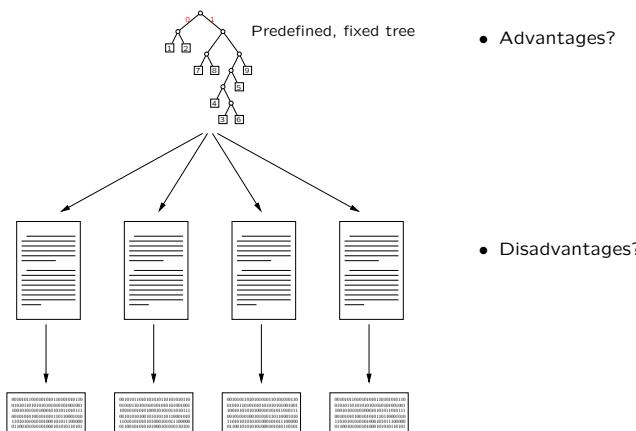

UW CSE326 Sp '02: 19—Compression 12

Two-Pass Decoding

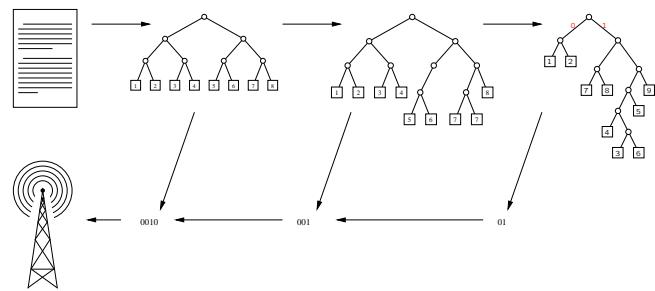

UW CSE326 Sp '02: 19—Compression 13

Static Encoding/Decoding

UW CSE326 Sp '02: 19—Compression 14

— Adaptive Encoding —

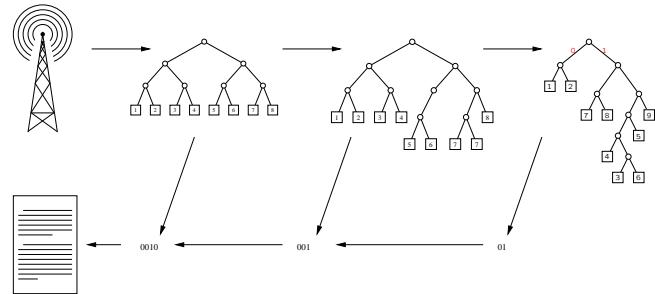

Build tree *while* reading & encoding input

UW CSE326 Sp '02: 19—Compression

15

— Adaptive Decoding —

Decoder builds the same tree as the encoder!

UW CSE326 Sp '02: 19—Compression

16

— Adaptive Coding Pseudo-code —

```
Encode(Text t, Output os)
{
    EncodingTree T.InitDefault();
    while (t) {
        ch = t.getch();
        os << T.Encode(ch);
        T.Update(ch);
    }
}

Decode(Input is)
{
    Text t;
    EncodingTree T.InitDefault();
    while (is) {
        ch = is.getch();
        t.Append(T.Decode(ch));
        T.Update(ch);
    }
    return t;
}
```

UW CSE326 Sp '02: 19—Compression

17

— Limitations of Huffman Encoding —

- Only considers *frequency* of letters, not *context*
- Certain *groups* may appear frequently
ing, the, ed, ...
- Could Huffman Code *pairs* or *triplets* of letters instead
Disadvantages?

18

UW CSE326 Sp '02: 19—Compression

— Lempel-Ziv Encoding —

Dictionary of Sequences

0	a
1	b
2	c
:	
24	y
25	z
26	ed
27	ing
28	the
29	in
:	

1. Find longest prefix of text that's in the dictionary
2. Output *code number* of prefix
3. Update dictionary
4. Advance Text

19

UW CSE326 Sp '02: 19—Compression

— Lempel-Ziv Pseudo-code —

```
LZEncode(Text t, Output os)
{
    Dictionary D;
    while (!t.done()) {
        match = Longest match of t in D;
        D.Add(last_match + match[0]);
        last_match = match;
        os << D.Index(match);
    }
}
```

How to decode?

20

UW CSE326 Sp '02: 19—Compression

— Example —

COCOA AND BANNANAS

21

UW CSE326 Sp '02: 19—Compression

— Important Details —

What happens when the dictionary fills up?

- Stop inserting new entries
- Clear the dictionary and start over
- Overwrite an infrequently used sequence
- Increase size of dictionary

22

UW CSE326 Sp '02: 19—Compression

— Important Details —

How to implement the dictionary?

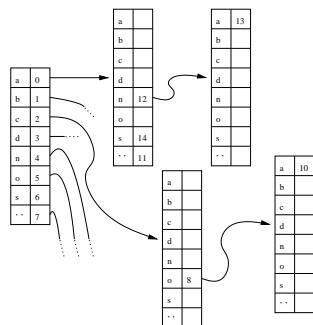

- List?
- Array?
- Balanced tree?
- Trie?

23

UW CSE326 Sp '02: 19—Compression

— Why Try Tries? —

Want longest-match lookups to be easy

Why must any prefix of a sequence be in the dictionary?

— Comparing Huffman and Lempel-Ziv —

our textbook	10576224 bits
two-pass Huffman	6469752 bits (61%)
adaptive Huffman	6470800 bits
Lempel-Ziv	4493168 bits (43%)
