# 8: Splay Trees

CSE326 Spring 2002

April 16, 2002

## Move-to-Front Heuristic ———

Search for Pebbles:

- Move found item to front of list
- Frequently searched items will move to start of list
  - Effective both theoretically and practically

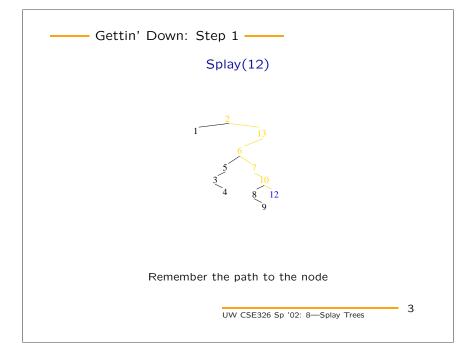

UW CSE326 Sp '02: 8—Splay Trees

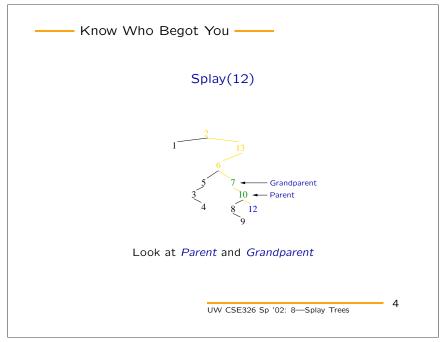

#### Splaying —

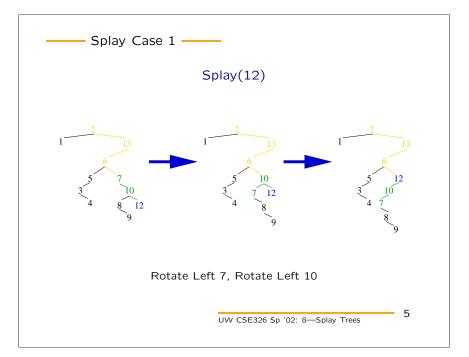

#### Splay(12)

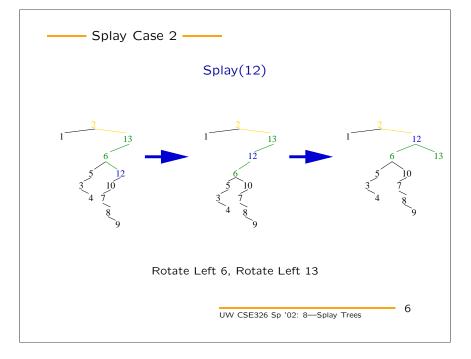

Move-To-Front for Trees

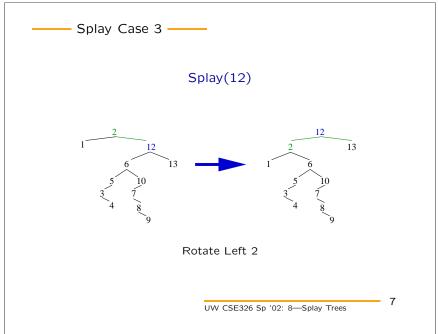

UW CSE326 Sp '02: 8—Splay Trees

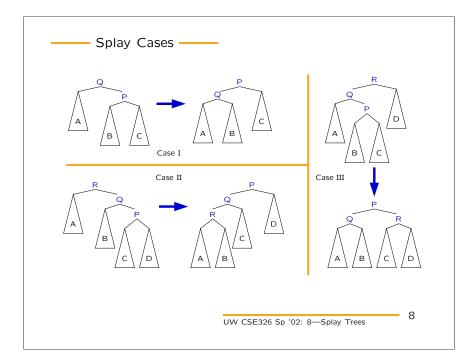

## - All Dressed Up ----

 ${\rm Splay}(k) \ \ {\rm Splay} \ k, \ {\rm or} \ {\rm predecessor} \ {\rm or} \ {\rm successor} \ {\rm to} \ k, \ {\rm to} \ {\rm root}, \\ {\rm depending} \ {\rm if} \ k \ {\rm is} \ {\rm in} \ {\rm the} \ {\rm tree}.$ 

Insert(k) Splay(k), then update

 $\mathsf{Delete}(k)$   $\mathsf{Splay}(k)$ , if root is k, then remove it, and  $\mathsf{Concat}(A,B)$ 

UW CSE326 Sp '02: 8—Splay Trees

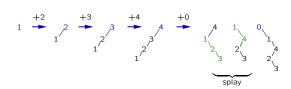

Concatenation ——

Concat $(T_1, T_2)$ : Splay $(+\infty, T_1)$ , then join  $T_2$  as right child of  $T_1$ .

UW CSE326 Sp '02: 8—Splay Trees

#### Example ———

UW CSE326 Sp '02: 8—Splay Trees

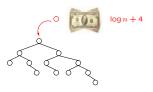

#### Amortized Analysis ———

- Splaying is the expensive operation
- $\bullet$  Sometimes we do more than  $O(\log n)$  work per node. . .
- Sometimes we do *less* than  $O(\log n)$  work per node. . .
- But it balances out: m operations in a tree with at most n nodes takes  $O(m \log n)$  time!
- Easy to say, harder to prove

UW CSE326 Sp '02: 8—Splay Trees

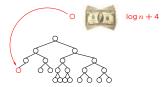

#### Worst-Case Analysis ———

 $\mathsf{Time} = \mathsf{Money}$ 

We proved we needed to spend at most  $\log n + 4$  time per AVL insertion

## - Worst-Case Analysis ----

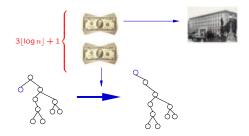

If the insertion was easy, our analysis loses

UW CSE326 Sp '02: 8—Splay Trees

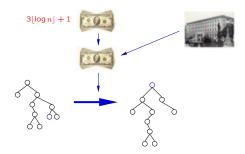

#### – Amortized Analysis —

If the splay was easy, bank the left-over money

UW CSE326 Sp '02: 8—Splay Trees

#### Amortized Analysis

If the splay was hard,  $\ensuremath{\textit{use}}$  money from the bank

17

#### - Amortized Analysis -----

- Always  $invest \ 3\lfloor \log n \rfloor + 1 \ \mathrm{per}$  splay
- Prove there's *always* enough money in the bank for any operation
- Then  $O(m \log n)$  time to do m operations

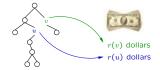

UW CSE326 Sp '02: 8—Splay Trees

18

**-** 19

#### Store Money in the Tree

 $r(v) = \lfloor \log \operatorname{size} \operatorname{of} \operatorname{subtree} \operatorname{at} v \rfloor$ 

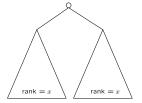

UW CSE326 Sp '02: 8—Splay Trees

#### Ranks are Logarithms ———

Rank of parent at least that of any child, but sometimes not greater.

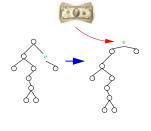

If both children have same rank, than rank of parent is larger  $\,$ 

UW CSE326 Sp '02: 8—Splay Trees

21

#### The Money Invariant ———

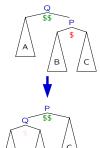

- ullet Each node v has r(v) dollars
- $\bullet \ \, \text{If} \ \ \, v \ \, \text{moves} \ \ \, up, \ \ \, add \ \, \text{more} \\ \text{money to} \, \, v \\$

 $\bullet \ \ \text{If} \ v \ \ \text{moves} \ \ \frac{\textit{down, take}}{\textit{money}} \\ \text{from} \ \ v \\$ 

UW CSE326 Sp '02: 8—Splay Trees

#### The Cost of Splaying: I ———

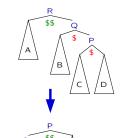

- Always the last step
- Only ranks of P and Q change
- r'(P) = r(Q)
- Get r(P) dollars
- Need  $r'(Q) \le r'(P)$  dollars
- Need \$1 to do the rotation
- Total:  $\leq r'(P) r(P) + 1$

23

- 22

## The Cost of Splaying: II ———

- Need r'(Q) + r'(R) - (r(P) + r(Q))  $\leq \ 2(r'(P) - r(P))$
- If r'(P) > r(P), then 3(r'(P) r(P)) is enough to pay for the rotation, too
- Otherwise, r'(P) = r(P), so do we need \$1 to pay for the rotation?

UW CSE326 Sp '02: 8—Splay Trees

- 24

#### The Cost of Splaying —

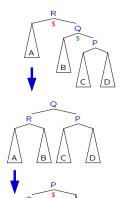

- If we pay \$1 for each case II, could pay  $\Theta(n)$ , and we need  $O(\log n)$
- If cost only depends on rank difference, we'll be okay:

$$\begin{array}{l} 3(r^{(1)}(P) - r(P)) \\ + \ 3(r^{(2)}(P) - r^{(1)}(P)) \\ + \ 3(r^{(3)}(P) - r^{(2)}(P)) \\ \vdots \\ + \ 3(r^{(k)}(P) - r^{(k-1)}(P)) + 1 \\ = \ 3(r^{(k)}(P) - r(P)) + 1 \\ \le \ 3\lfloor \log n \rfloor + 1 \end{array}$$

UW CSE326 Sp '02: 8—Splay Trees

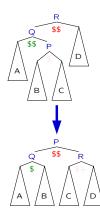

25

# The Cost of Splaying: II ——

- If r'(P) = r(P), then
  - $\star \ r'(R) < r(P)$  Otherwise r'(P) > r(P)
  - $\star \ r'(Q) \le r'(P) = r(P) \le r(Q)$
  - $\star$  R's  $\$ \Rightarrow$  P
  - $\star$  P's \$  $\Rightarrow$  R, with extra to pay for rotation

## The Cost of Splaying: III —

- R's \$ ⇒ new P
- Q's \$ stays put (may waste some)
- P's  $\$ \Rightarrow$  new R, and pay r'(P) r(P) extra \$s
- • If r'(P) > r(P), we're within 3(r'(P) - r(P)) after paying for rotation
- If r'(P) = r(P), then
  - $\star \ r'(P) = r(P) = r(Q) = r(R)$
  - $\star \ \, \text{Hence} \,\, r'(Q) < r'(P) \,\, \text{or} \\ r'(R) < r'(P), \,\, \text{otherwise} \\ r'(P) > r(P)$
  - $\star$  So r'(Q) < r(Q) or r'(R) < r(P), and can use extra  $\$  to pay for rotation

UW CSE326 Sp '02: 8—Splay Trees

- 27

#### So What Does It All Mean? —

If we perform m operations an have at most n nodes:

- $Any \operatorname{Splay}(K)$  needs at most  $3\lfloor \log n \rfloor + 1 \$$  to maintain money invariant
- Any lookup or delete performs at most 2 splays: at most  $(6 \lfloor \log n \rfloor + 2)$
- Any insert performs 1 splay, plus money for the new root: at most  $\{4 \lfloor \log n \rfloor\}$
- ullet O( $m \log n$ ) dollars total needed—matches AVL trees!

UW CSE326 Sp '02: 8—Splay Trees
