

# CSE341: Programming Languages Lecture 26 Course Victory Lap

Dan Grossman Spring 2016

#### Final Exam

As also indicated in class-list email:

- Next Monday, 8:30-10:20
- Intention is to focus primarily on material since the midterm
  - Including topics on homeworks and not on homeworks
  - May also have a little ML, just like the course has had
- You will need to write code and English

# Victory Lap

A victory lap is an extra trip around the track

By the exhausted victors (us) ☺

#### Review course goals

Slides from Introduction and Course-Motivation

Some big themes and perspectives

Stuff for five years from now more than for the final

Do your course evaluations!!!

### Thank you!

- Huge thank-you to your TAs
  - Great team effort
  - Deep understanding of material despite all having different
     341 instructors
  - Great sections, timely grading, etc., etc.

# Thank you!

- And a huge thank you to all of you
  - Great attitude about a very different view of software
  - Good class attendance and questions
  - Occasionally laughed at stuff ©
- Computer science ought to be challenging and fun!

### [From Lecture 1]

- Many essential concepts relevant in any programming language
  - And how these pieces fit together
- Use ML, Racket, and Ruby languages:
  - They let many of the concepts "shine"
  - Using multiple languages shows how the same concept can "look different" or actually be slightly different
  - In many ways simpler than Java
- Big focus on functional programming
  - Not using mutation (assignment statements) (!)
  - Using first-class functions (can't explain that yet)
  - But many other topics too

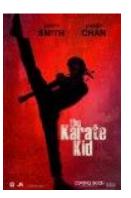

### [From Lecture 1]

Learning to think about software in this "PL" way will make you a better programmer even if/when you go back to old ways

It will also give you the mental tools and experience you need for a lifetime of confidently picking up new languages and ideas

[Somewhat in the style of *The Karate Kid* movies (1984, 2010)]

### [From Course Motivation]

- No such thing as a "best" PL
- Fundamental concepts easier to teach in some (multiple) PLs
- A good PL is a relevant, elegant interface for writing software
  - There is no substitute for precise understanding of PL semantics
- Functional languages have been on the leading edge for decades
  - Ideas have been absorbed by the mainstream, but very slowly
  - First-class functions and avoiding mutation increasingly essential
  - Meanwhile, use the ideas to be a better C/Java/PHP hacker
- Many great alternatives to ML, Racket, and Ruby, but each was chosen for a reason and for how they complement each other

### [From Course Motivation]

SML, Racket, and Ruby are a useful combination for us

	dynamically typed	statically typed
functional	Racket	SML
object-oriented	Ruby	Java

ML: polymorphic types, pattern-matching, abstract types & modules Racket: dynamic typing, "good" macros, minimalist syntax, eval Ruby: classes but not types, very OOP, mixins [and much more]

Really wish we had more time:

Haskell: laziness, purity, type classes, monads

Prolog: unification and backtracking

[and much more]

#### Benefits of No Mutation

[An incomplete list]

- Can freely alias or copy values/objects: Unit 1
- 2. More functions/modules are equivalent: Unit 4
- 3. No need to make local copies of data: Unit 5
- 4. Depth subtyping is sound: Unit 8

State updates are appropriate when you are modeling a phenomenon that is inherently state-based

A fold over a collection (e.g., summing a list) is not!

# Some other highlights

- Function closures are really powerful and convenient...
  - ... and implementing them is not magic
- Datatypes and pattern-matching are really convenient...
  - and exactly the opposite of OOP decomposition
- Sound static typing prevents certain errors...
  - ... and is inherently approximate
- Subtyping and generics allow different kinds of code reuse...
  - ... and combine synergistically
- Modularity is really important; languages can help

# From the syllabus

#### Successful course participants will:

- Internalize an accurate understanding of what functional and object-oriented programs mean
- Develop the skills necessary to learn new programming languages quickly
- Master specific language concepts such that they can recognize them in strange guises
- Learn to evaluate the power and elegance of programming languages and their constructs
- Attain reasonable proficiency in the ML, Racket, and Ruby languages and, as a by-product, become more proficient in languages they already know

#### The End

This really is my favorite course and it probably always will be

Don't be a stranger!

Time for ask-me-anything questions?
