

Instruction Level Parallelism (ILP)

- A necessary aside: floating point
- Incorporating floating point in the pipeline
- Scoreboarding
 - Multiple functional units (superscalar)
 - Multi-issue
 - Out of order execution / completion
 - In-order issue

1

(IEEE 754) Floating Point Representation

$$(-1)^S \times F \times 2^E$$

0: Positive
1: Negative

127 bias

Leading '1' is implied,
but not represented

Key Points:

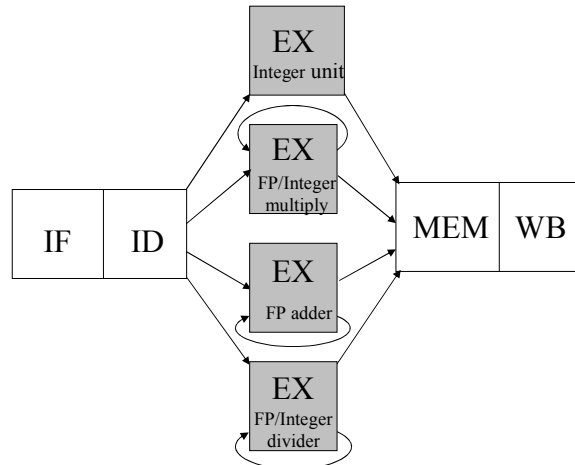

- Limited precision
- Limited range
- Distinct set of instructions
- Distinct set of registers
- Slow to operate on (relative to integers)

What does 0x00000000 represent?

How is 3.25 represented?

2

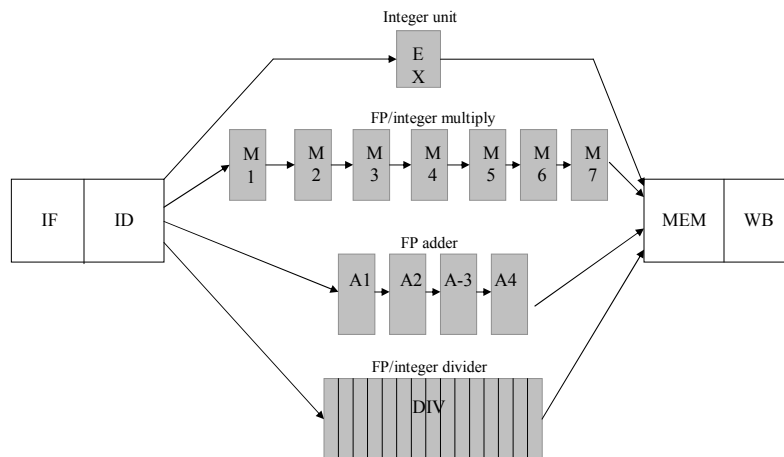

Floating Point and the Pipeline

The MIPS pipeline with floating-point functional units.

3

Pipelining the FP Units

4

New Problems

- **Structural Hazards**
 - FP divide takes many cycles, and is not pipelined
 - May need to write more than one register in a cycle
- **Instructions may complete out of order**
 - WAW (write-after-write) hazards are possible
 - “Precise exceptions” are more difficult to implement
- **Longer pipelines may result in more difficulty dealing with RAW (read-after-write) dependences**

Once we deal with those problems, a new problem is revealed:
can't keep all the functional units busy

5

Addressing the Problem

- Consider the following code fragment:
 DIVD F0, F2, F4
 ADDD F10, F0, F8
 MULTD F12, F8, F14
- What is the problem?
 - ADDD stalls due to RAW hazard
 - MULTD has no dependences, but is marooned behind ADDD
- In-order execution limits performance

6

Out of Order Execution

- Key idea: Allow **out-of-order execution**
DIVD F0, F2, F4
ADDD F10, F0, F8
SUBD F12, F8, F14
- Leads to **out-of-order completion**
- The technique we'll look at: scoreboarding
- (Dates to the CDC 6600 (1964))
- All instructions pass through a single issue stage for scheduling (**in-order issue**)

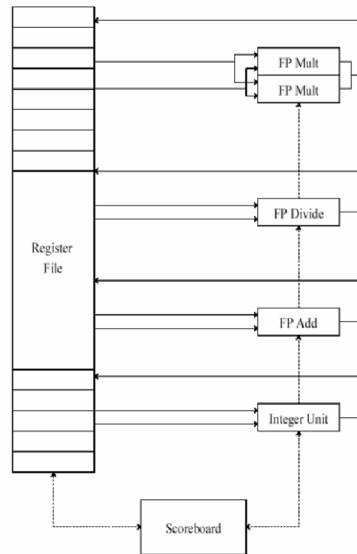

7

The MIPS Pipeline and Scoreboarding

- Ignore memory interface components for simplicity
- IF fetches an instruction each cycle
 - There is a small window (buffer) of already fetched instructions
 - If issue stalls, the buffer fills
 - When instructions complete, they leave the buffer
- Scoreboarding: 4-stage execution
 - Issue – check structural WAW hazards, stall until clear
 - Read ops – check RAW. Wait till operands ready, read regs
 - Execute – execute operation. Notify scoreboard when done
 - Write – check for WAR. Stall write until clear

8

Dynamic MIPS Datapath

9

Scoreboard Implications

- **Out-of-order completion => WAR, WAW hazards?**
- **Solutions for WAR**
 - Queue both the operation and copies of its operands
 - Read registers only during Read Operands stage
- **For WAW, must detect hazard: stall until other completes**
- **Need to have multiple instructions in execution phase => multiple execution units or pipelined execution units**
- **Scoreboard keeps track of dependencies, state or operations**
- **Scoreboard replaces ID, EX, WB with 4 stages**

10

Dealing with Hazards

- **Structural hazards**
 - Obvious – desired EX unit must be free
- **Data Hazards**
 - More complex due to parallel multi-cycle EX units
 - **RAW** – delay operand fetch until producing instruction finishes register write back
 - **WAW** – issue only one instruction at a time for each destination register
 - **WAR** – delay write back until reading inst has fetched the previous value

11

Four Stages of Scoreboard Control

- 1. Issue**—decode instructions & check for structural hazards (ID1)

If a functional unit for the instruction is free and no other active instruction has the same destination register (WAW), then issue the instruction. Otherwise, stall this and all following instructions.
- 2. Read operands**—wait until no flow dependences (RAW), then read operands from registers

No forwarding done. Why? Not as useful in this situation, as each functional unit writes a register as soon as the value is available.
- 3. Execution**—operate on operands (EX)
- 4. Write result**—finish execution (WB)

Must wait for earlier instructions to have read result register (WAR)

12

Scoreboard: 3 Tables + Rules

- 1. Instruction status**—which of 4 steps the instruction is in
- 2. Functional unit status**—Indicates the state of the functional unit (FU). 9 fields for each functional unit
 - Busy**—Indicates whether the unit is busy or not
 - Op**—Operation to perform in the unit (e.g., + or -)
 - Fi**—Destination register
 - Fj, Fk**—Source-register numbers
 - Qj, Qk**—Functional units producing source registers Fj, Fk
 - Rj, Rk**—Flags indicating if Fj, Fk are ready
- 3. Register result status**—Indicates which functional unit will write each register.

13

Detailed Scoreboard Pipeline Control

Instruction status	Wait until	Bookkeeping
Issue	Not busy (FU) and not result(D)	$Busy(FU) \leftarrow \text{yes}; Op(FU) \leftarrow op;$ $Fi(FU) \leftarrow 'D'; Fj(FU) \leftarrow 'S1';$ $Fk(FU) \leftarrow 'S2'; Qj \leftarrow Result('S1');$ $Qk \leftarrow Result('S2'); Rj \leftarrow \text{not } Qj;$ $Rk \leftarrow \text{not } Qk; Result('D') \leftarrow FU;$
Read operands	Rj and Rk	$Rj \leftarrow \text{No}; Rk \leftarrow \text{No}$
Execution complete	Functional unit done	
Write result	$\forall f((Fj(f) \neq Fi(FU) \text{ or } Rj(f) = \text{No}) \&$ $(Fk(f) \neq Fi(FU) \text{ or } Rk(f) = \text{No}))$	$\forall f(\text{if } Qj(f) = FU \text{ then } Rj(f) \leftarrow \text{Yes});$ $\forall f(\text{if } Qk(f) = FU \text{ then } Rj(f) \leftarrow \text{Yes});$ $Result(Fi(FU)) \leftarrow 0; Busy(FU) \leftarrow \text{No}$

14

Scoreboard Example

- Assume 2 MULT, 1 DIV, 1 ADD/SUB FP units, plus 1 integer ALU
- EX stage timings:
 - Int ALU takes 1 cycle
 - FP adder takes 2 cycles
 - FP mult takes 10 cycles
 - FP div takes 40 cycles
