

Installing a java JDK in Linux (already done on lab machines!)

**If using ubuntu**, open a terminal and execute the following commands, entering your password if prompted and hitting Y to agree to the install if prompted:

```
sudo apt-get update
```

```
sudo apt-get install openjdk-6-jdk
```

**If running Fedora**, use the GUI menus: System -> Administration -> Add/Remove Software

Search for "jdk"

Select and install the Java Platform Standard Development Kit package (or something along those lines).

If you have any trouble with this, email me or post to the message board!
