The Development System?

Definition - The *development system* is the collection of people, processes and tools that together produce the system under development.

- ➤ The development system is itself a system,
- ➤ It has functions, and attributes.
- ➤ It is amenable to analysis, and deliberate design.

Software Engineerign is studying this system.

The tool chain is a big part of it.

The Development System

Sometimes the development system doesn't work.

> That's bad.

Sometimes the development system gets in the way.

> That's slightly less bad.

Sorting this out tends to take a lot of (calendar) time.

> That's risky, sometimes fatal to the project.

The right development system off-loads people so they can do more of what we get paid for. So, do a "Zero Feature Release" and find out while you have time.
