Minimum Spanning Trees

## Minimum Spanning Tree

Undirected Graph  $G=(V,E)$  with edge weights

## Greedy Algorithms for Minimum Spanning Tree

- **[Prim]** Extend a tree by including the cheapest outgoing edge
- **[Kruskal]** Add the cheapest edge that joins disjoint components
- **[ReverseDelete]** Delete the most expensive edge that does not disconnect the graph

## Why do the greedy algorithms work?

- For simplicity, assume all edge costs are distinct

## Edge inclusion lemma

- Let  $S$  be a subset of  $V$ , and suppose  $e = (u, v)$  is the minimum cost edge of  $E$ , with  $u$  in  $S$  and  $v$  in  $V-S$
- $e$  is in every minimum spanning tree of  $G$ 
  - Or equivalently, if  $e$  is not in  $T$ , then  $T$  is not a minimum spanning tree

$e$  is the minimum cost edge between  $S$  and  $V-S$

## Proof

- Suppose  $T$  is a spanning tree that does not contain  $e$
- Add  $e$  to  $T$ , this creates a cycle
- The cycle must have some edge  $e_1 = (u_1, v_1)$  with  $u_1$  in  $S$  and  $v_1$  in  $V-S$

- $T_1 = T - \{e_1\} + \{e\}$  is a spanning tree with lower cost
- Hence,  $T$  is not a minimum spanning tree

## Optimality Proofs

- Prim's Algorithm computes a MST
- Kruskal's Algorithm computes a MST
  
- Show that when an edge is added to the MST by Prim or Kruskal, the edge is the minimum cost edge between S and V-S for some set S.

## Prim's Algorithm

```
S = { }; T = { };  
while S != V  
    choose the minimum cost edge  
    e = (u,v), with u in S, and v in V-S  
    add e to T  
    add v to S
```

## Prove Prim's algorithm computes an MST

- Show an edge e is in the MST when it is added to T

## Kruskal's Algorithm

```
Let C = {{v1}, {v2}, . . . , {vn}}; T = { }  
while |C| > 1  
    Let e = (u, v) with u in Ci and v in Cj be the  
    minimum cost edge joining distinct sets in C  
    Replace Ci and Cj by Ci U Cj  
    Add e to T
```

## Prove Kruskal's algorithm computes an MST

- Show an edge e is in the MST when it is added to T

## Reverse-Delete Algorithm

- Lemma: The most expensive edge on a cycle is never in a minimum spanning tree

### Dealing with the assumption of no equal weight edges

- Force the edge weights to be distinct
  - Add small quantities to the weights
  - Give a tie breaking rule for equal weight edges

### Application: Clustering

- Given a collection of points in an  $r$ -dimensional space, and an integer  $K$ , divide the points into  $K$  sets that are closest together

### Distance clustering

- Divide the data set into  $K$  subsets to maximize the distance between any pair of sets
  - $\text{dist}(S_1, S_2) = \min \{ \text{dist}(x, y) \mid x \in S_1, y \in S_2 \}$

### Divide into 2 clusters

### Divide into 3 clusters

### Divide into 4 clusters

## Distance Clustering Algorithm

Let  $C = \{\{v_1\}, \{v_2\}, \dots, \{v_n\}\}$ ;  $T = \{\}$

while  $|C| > K$

Let  $e = (u, v)$  with  $u$  in  $C_i$  and  $v$  in  $C_j$  be the minimum cost edge joining distinct sets in  $C$

Replace  $C_i$  and  $C_j$  by  $C_i \cup C_j$

## K-clustering
