#### **Network Flow Definitions**

- Flowgraph: Directed graph with distinguished vertices s (source) and t (sink)
- Capacities on the edges, c(e) >= 0
- Problem, assign flows f(e) to the edges such that:
  - $0 \le f(e) \le c(e)$
  - Flow is conserved at vertices other than s and t
    - Flow conservation: flow going into a vertex equals the flow going out
  - The flow leaving the source is a large as possible

#### Find a maximum flow

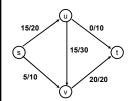

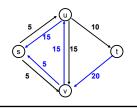

# Residual Graph

- · Flow graph showing the remaining capacity
- Flow graph G, Residual Graph G<sub>R</sub>
  - G: edge e from u to v with capacity c and flow f
  - G<sub>R</sub>: edge e' from u to v with capacity c f
  - G<sub>R</sub>: edge e" from v to u with capacity f

# **Augmenting Path Lemma**

- Let P = v<sub>1</sub>, v<sub>2</sub>, ..., v<sub>k</sub> be a path from s to t with minimum capacity b in the residual graph.
- b units of flow can be added along the path P in the flow graph.

#### **Proof**

- · Add b units of flow along the path P
- What do we need to verify to show we have a valid flow after we do this?

while not done

Construct residual graph  $G_R$ Find an s-t path P in  $G_R$  with capacity b > 0Add b units along in G

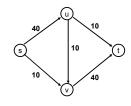

If the sum of the capacities of edges leaving S is at most C, then the algorithm takes at most C iterations

# Cuts in a graph

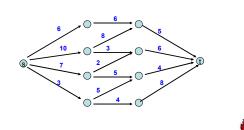

- Cut: Partition of V into disjoint sets S, T with s in S and t in T.
- Cap(S,T): sum of the capacities of edges from S to T
- Flow(S,T): net flow out of S
  - Sum of flows out of S minus sum of flows into S
- Flow(S,T) <= Cap(S,T)

# Minimum value cut

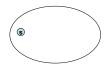

# Find a minimum value cut

#### MaxFlow – MinCut Theorem

- There exists a flow which has the same value of the minimum cut
- Proof: Consider a flow where the residual graph has no s-t path with positive capacity
- Let S be the set of vertices in G<sub>R</sub> reachable from s with paths of positive capacity

Let S be the set of vertices in  $G_R$  reachable from s with paths of positive capacity

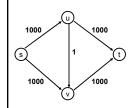

#### Max Flow - Min Cut Theorem

- Ford-Fulkerson algorithm finds a flow where the residual graph is disconnected, hence FF finds a maximum flow.
- If we want to find a minimum cut, we begin by looking for a maximum flow.

#### Performance

 The worst case performance of the Ford-Fulkerson algorithm is horrible

# Better methods of finding augmenting paths

- Find the maximum capacity augmenting path
  - O(m<sup>2</sup>log(C)) time
- · Find the shortest augmenting path
  - O(m<sup>2</sup>n)
- · Find a blocking flow in the residual graph
  - O(mnlog n)
