

### 5.1 Mergesort

### Divide-and-Conquer

### Divide-and-conquer.

- Break up problem into several parts.
- Solve each part recursively.
- Combine solutions to sub-problems into overall solution.

### Most common usage.

- Break up problem of size n into two equal parts of size  $\frac{1}{2}$ n.
- Solve two parts recursively.
- . Combine two solutions into overall solution in linear time.

### Consequence.

- . Brute force: n<sup>2</sup>.
- Divide-and-conquer: n log n.

Divide et impera. Veni, vidi, vici. - Julius Caesar

### Sorting

Sorting. Given n elements, rearrange in ascending order.

Obvious sorting applications.
List files in a directory.
Organize an MP3 library.
List names in a phone book.
Display Google PageRank

results.

Problems become easier once sorted.

Find the median. Find the closest pair. Binary search in a

database.

Identify statistical

outliers.

Find duplicates in a mailing

Non-obvious sorting applications.

Data compression.
Computer graphics.
Interval scheduling.
Computational biology.
Minimum spanning tree.
Supply chain management.
Simulate a system of
particles.

Book recommendations on

Load balancing on a parallel

computer.

. . .

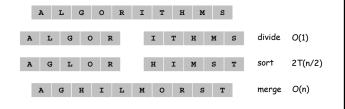

## Mergesort

### Mergesort.

- Divide array into two halves.
- Recursively sort each half.
- Merge two halves to make sorted whole.

Jon von Neumann (1945)

### A Useful Recurrence Relation

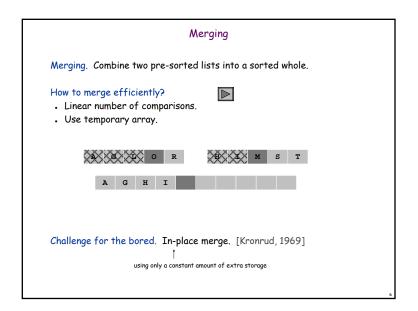

Def. T(n) = number of comparisons to mergesort an input of size n.

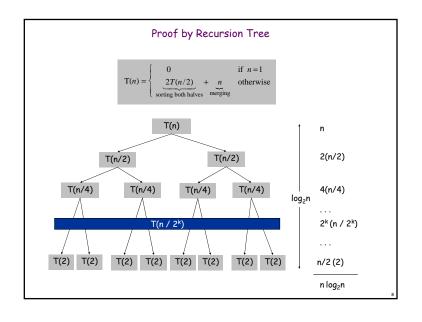

### Mergesort recurrence.

$$T(n) \leq \left\{ \underbrace{ \begin{array}{c} 0 \\ T(\left \lceil n/2 \right \rceil) \\ \text{solve left half} \end{array}}_{\text{solve right half}} + \underbrace{ T(\left \lfloor n/2 \right \rfloor) + n \\ \text{merging} }_{\text{merging}} \text{ otherwise} \right.$$

Solution.  $T(n) = O(n \log_2 n)$ .

Assorted proofs. We describe several ways to prove this recurrence. Initially we assume n is a power of 2 and replace  $\leq$  with =.

### Proof by Telescoping

Claim. If T(n) satisfies this recurrence, then T(n) =  $n \log_2 n$ .

assumes n is a power of 2

$$T(n) = \begin{cases} 0 & \text{if } n = 1\\ 2T(n/2) + \underbrace{n}_{\text{sorting both halves}} & \text{merging} \end{cases}$$

Pf. For n > 1:

$$\frac{T(n)}{n} = \frac{2T(n/2)}{n} + 1$$

$$= \frac{T(n/2)}{n/2} + 1$$

$$= \frac{T(n/4)}{n/4} + 1 + 1$$
...
$$= \frac{T(n/n)}{n/n} + \underbrace{1 + \dots + 1}_{\log_2 n}$$

$$= \log_2 n$$

### Analysis of Mergesort Recurrence

Claim. If T(n) satisfies the following recurrence, then  $T(n) \le n \lceil \lg n \rceil$ .

$$T(n) \leq \begin{cases} 0 & \text{if } n=1\\ \underbrace{T(\lceil n/2 \rceil)}_{\text{solve left half}} + \underbrace{T(\lfloor n/2 \rfloor)}_{\text{solve right half}} + \underbrace{n}_{\text{merging}} & \text{otherwise} \end{cases}$$

Pf. (by induction on n)

- Base case: n = 1.
- Define  $n_1 = \lfloor n/2 \rfloor$ ,  $n_2 = \lceil n/2 \rceil$ .
- Induction step: assume true for 1, 2, ..., n-1.

$$\begin{array}{rcl} T(n) & \leq & T(n_1) + T(n_2) + n \\ & \leq & n_1 \lceil \lg n_1 \rceil + n_2 \lceil \lg n_2 \rceil + n \\ & \leq & n_1 \lceil \lg n_2 \rceil + n_2 \lceil \lg n_2 \rceil + n \\ & = & n \lceil \lg n_2 \rceil + n \\ & \leq & n(\lceil \lg n \rceil - 1) + n \\ & = & n \lceil \lg n \rceil \end{array}$$

$$\begin{array}{rcl} n_2 &=& \left \lceil n/2 \right \rceil \\ &\leq & \left \lceil 2^{\left \lceil \lg n \right \rceil}/2 \right \rceil \\ &=& 2^{\left \lceil \lg n \right \rceil}/2 \\ \Rightarrow & \left \lg n_2 \leq \left \lceil \lg n \right \rceil -1 \end{array}$$

log<sub>2</sub>n

### Proof by Induction

Claim. If T(n) satisfies this recurrence, then  $T(n) = n \log_2 n$ .

assumes n is a power of 2

$$T(n) = \begin{cases} 0 & \text{if } n = 1\\ 2T(n/2) + n & \text{otherwise} \\ \text{sorting both halves} & \text{merging} \end{cases}$$

Pf. (by induction on n)

Base case: n = 1.

• Inductive hypothesis:  $T(n) = n \log_2 n$ .

• Goal: show that  $T(2n) = 2n \log_2 (2n)$ .

$$T(2n) = 2T(n) + 2n$$

$$= 2n\log_2 n + 2n$$

$$= 2n(\log_2(2n) - 1) + 2n$$

$$= 2n\log_2(2n)$$

### 5.3 Counting Inversions

### Counting Inversions

Music site tries to match your song preferences with others.

- . You rank n songs.
- Music site consults database to find people with similar tastes.

Similarity metric: number of inversions between two rankings.

. My rank: 1, 2, ..., n.

Divide-and-conquer.

- Your rank: a<sub>1</sub>, a<sub>2</sub>, ..., a<sub>n</sub>.
- . Songs i and j inverted if i < j, but a; > a;.

	Songs				
	Α	В	С	D	Ε
Me	1	2	3	4	5
You	1	3	4	2	5

Inversions 3-2, 4-2

Brute force: check all  $\Theta(n^2)$  pairs i and j.

## Counting Inversions: Divide-and-Conquer

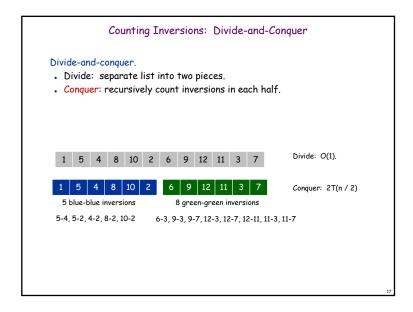

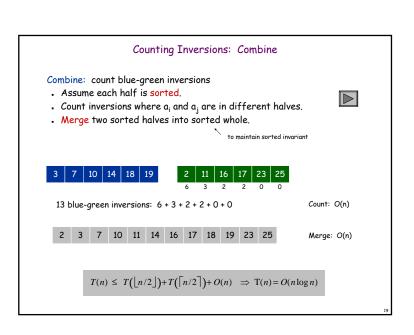

### Applications

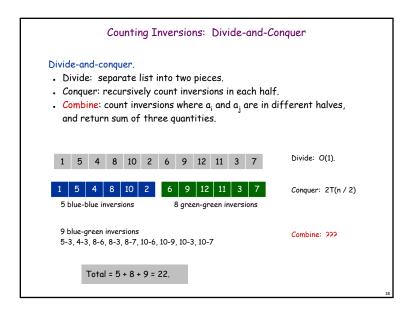

### Applications.

- Voting theory.
- . Collaborative filtering.
- Measuring the "sortedness" of an array.
- Sensitivity analysis of Google's ranking function.
- Rank aggregation for meta-searching on the Web.
- Nonparametric statistics (e.g., Kendall's Tau distance).

## Counting Inversions: Divide-and-Conquer Divide-and-conquer. Divide: separate list into two pieces. 1 5 4 8 10 2 6 9 12 11 3 7 Divide: O(1).

```
Counting Inversions: Implementation

Pre-condition. [Merge-and-Count] A and B are sorted.

Post-condition. [Sort-and-Count] L is sorted.

Sort-and-Count(L) {
    if list L has one element
        return 0 and the list L

    Divide the list into two halves A and B
    (r_A, A) ← Sort-and-Count(A)
    (r_B, B) ← Sort-and-Count(B)
    (r, L) ← Merge-and-Count(A, B)

return r = r_A + r_B + r and the sorted list L
}
```

### 5.4 Closest Pair of Points

### Closest Pair of Points: First Attempt

Divide. Sub-divide region into 4 quadrants.

### Closest Pair of Points

Closest pair. Given n points in the plane, find a pair with smallest Euclidean distance between them.

### Fundamental geometric primitive.

- Graphics, computer vision, geographic information systems, molecular modeling, air traffic control.
- Special case of nearest neighbor, Euclidean MST, Voronoi.

fast closest pair inspired fast algorithms for these problems

Brute force. Check all pairs of points p and q with  $\Theta(n^2)$  comparisons.

1-D version. O(n log n) easy if points are on a line.

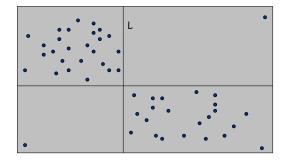

Assumption. No two points have same x coordinate.

to make presentation cleaner

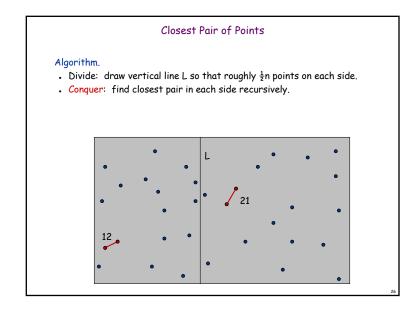

### Closest Pair of Points: First Attempt

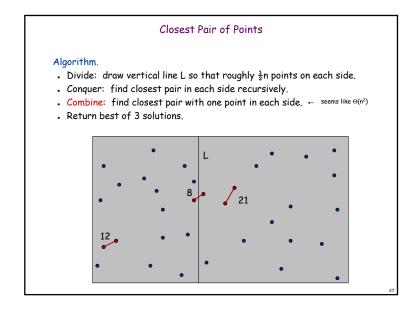

Divide. Sub-divide region into 4 quadrants.

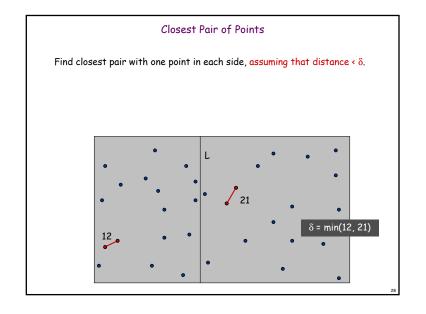

Obstacle. Impossible to ensure n/4 points in each piece.

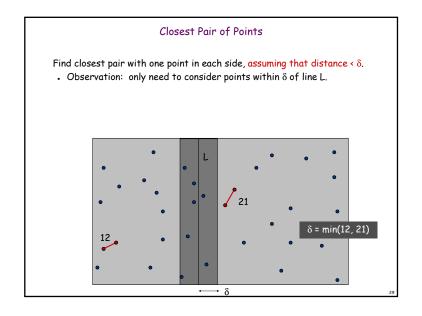

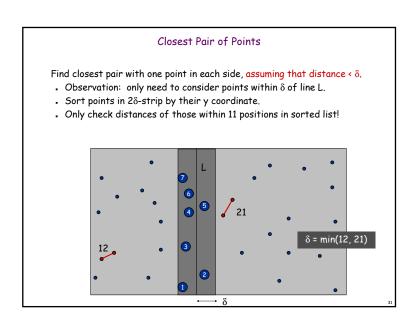

## Algorithm. Divide: draw vertical line L so that roughly ½n points on each side.

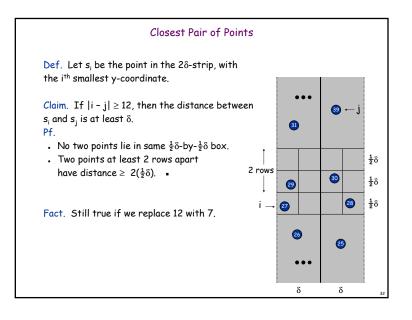

# Closest Pair of Points Find closest pair with one point in each side, assuming that distance $< \delta$ . Observation: only need to consider points within $\delta$ of line L. Sort points in $2\delta$ -strip by their y coordinate.

### Closest Pair Algorithm Closest-Pair( $p_1$ , ..., $p_n$ ) { Compute separation line L such that half the points O(n log n) are on one side and half on the other side. $\delta_1$ = Closest-Pair(left half) 2T(n / 2) $\delta_2$ = Closest-Pair(right half) $\delta = \min(\delta_1, \delta_2)$ Delete all points further than $\delta$ from separation line L O(n log n) Sort remaining points by y-coordinate. Scan points in y-order and compare distance between each point and next 11 neighbors. If any of these distances is less than $\delta$ , update $\delta$ . return δ.

### 5.5 Integer Multiplication

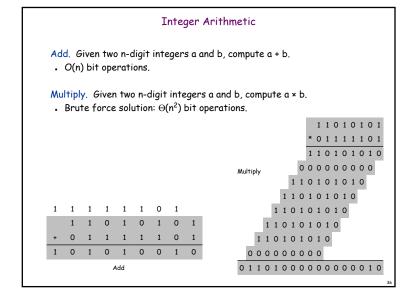

### Closest Pair of Points: Analysis

### Running time.

$$T(n) \le 2T(n/2) + O(n \log n) \Rightarrow T(n) = O(n \log^2 n)$$

- Q. Can we achieve O(n log n)?
- A. Yes. Don't sort points in strip from scratch each time.
- Each recursive returns two lists: all points sorted by y coordinate, and all points sorted by x coordinate.
- . Sort by merging two pre-sorted lists.

$$T(n) \le 2T(n/2) + O(n) \Rightarrow T(n) = O(n \log n)$$

### Divide-and-Conquer Multiplication: Warmup

### To multiply two n-digit integers:

- Multiply four ½n-digit integers.
- Add two  $\frac{1}{2}$ n-digit integers, and shift to obtain result.

$$\begin{array}{rcl} x & = & 2^{n/2} \cdot x_1 + x_0 \\ y & = & 2^{n/2} \cdot y_1 + y_0 \\ xy & = & \left(2^{n/2} \cdot x_1 + x_0\right) \left(2^{n/2} \cdot y_1 + y_0\right) = & 2^n \cdot x_1 y_1 + 2^{n/2} \cdot \left(x_1 y_0 + x_0 y_1\right) + x_0 y_0 \end{array}$$

$$T(n) = \underbrace{4T(n/2)}_{\text{recursive calls}} + \underbrace{\frac{\Theta(n)}{\text{add. shift}}} \Rightarrow T(n) = \Theta(n^2)$$

$$\uparrow$$
assumes n is a power of 2

Karatsuba Multiplication

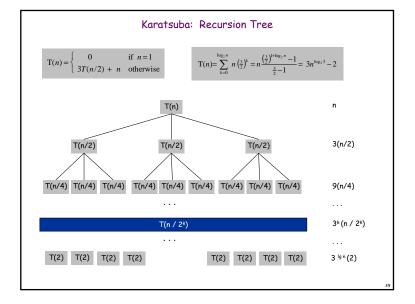

### To multiply two n-digit integers:

- Add two ½n digit integers.
- Multiply three  $\frac{1}{2}$ n-digit integers.
- Add, subtract, and shift  $\frac{1}{2}$ n-digit integers to obtain result.

$$\begin{array}{lll} x & = & 2^{n/2} \cdot x_1 + x_0 \\ y & = & 2^{n/2} \cdot y_1 + y_0 \\ xy & = & 2^n \cdot x_1 y_1 + 2^{n/2} \cdot \left( x_1 y_0 + x_0 y_1 \right) + x_0 y_0 \\ & = & 2^n \cdot x_1 y_1 + 2^{n/2} \cdot \left( (x_1 + x_0)(y_1 + y_0) - x_1 y_1 - x_0 y_0 \right) + x_0 y_0 \\ & & A & C & C \end{array}$$

Theorem. [Karatsuba-Ofman, 1962] Can multiply two n-digit integers in  $O(n^{1.585})$  bit operations.

$$\begin{split} T(n) &\leq \underbrace{T\left(\left\lfloor n/2\right\rfloor\right) + T\left(\left\lceil n/2\right\rceil\right) + T\left(1 + \left\lceil n/2\right\rceil\right)}_{\text{recursive calls}} \ + \underbrace{O(n)}_{\text{add. subtract, shift}} \\ \Rightarrow T(n) &= O(n^{\log_2 3}) \ = O(n^{1.585}) \end{split}$$

### Matrix Multiplication

### Matrix Multiplication

Matrix multiplication. Given two n-by-n matrices A and B, compute C = AB.

$$c_{ij} = \sum_{k=1}^n a_{ik} b_{kj}$$

$$\begin{bmatrix} c_{:1} & c_{:2} & \cdots & c_{:s} \\ c_{:1} & c_{:2} & \cdots & c_{:s} \\ \vdots & \vdots & \ddots & \vdots \\ c_{s1} & c_{s2} & \cdots & c_{sm} \end{bmatrix} = \begin{bmatrix} a_{:1} & a_{:2} & \cdots & a_{:s} \\ a_{:1} & a_{:2} & \cdots & a_{:s} \\ \vdots & \vdots & \ddots & \vdots \\ a_{s1} & a_{s2} & \cdots & a_{sm} \end{bmatrix} \times \begin{bmatrix} b_{:1} & b_{:2} & \cdots & b_{:s} \\ b_{:1} & b_{:2} & \cdots & b_{:s} \\ \vdots & \vdots & \ddots & \vdots \\ b_{s1} & b_{:2} & \cdots & b_{m} \end{bmatrix}$$

Brute force.  $\Theta(n^3)$  arithmetic operations.

Fundamental question. Can we improve upon brute force?

Matrix Multiplication: Key Idea

Key idea. multiply 2-by-2 block matrices with only 7 multiplications.

$$\begin{bmatrix} C_{11} & C_{12} \\ C_{21} & C_{22} \end{bmatrix} = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix} \times \begin{bmatrix} B_{11} & B_{12} \\ B_{21} & B_{22} \end{bmatrix}$$

$$C_{11} = P_5 + P_4 - P_2 + P_6$$

$$C_{12} = P_1 + P_2$$

$$C_{21} = P_3 + P_4$$

$$C_{22} = P_5 + P_1 - P_3 - P_7$$

- $P_1 = A_{11} \times (B_{12} B_{22})$  $P_2 = (A_{11} + A_{12}) \times B_{22}$  $\begin{array}{rclcrcl} & P_3 & = & (A_{21} + A_{22}) \times B_{11} \\ C_{11} & = & P_5 + P_4 - P_2 + P_6 \\ C_{12} & = & P_1 + P_2 \\ C_{21} & = & P_3 + P_4 \\ C_{22} & = & P_5 + P_1 - P_3 - P_7 \end{array} \qquad \begin{array}{rclcrcl} P_3 & = & (A_{21} + A_{22}) \times (B_{21} - B_{11}) \\ P_5 & = & (A_{11} + A_{22}) \times (B_{11} + B_{22}) \\ P_6 & = & (A_{12} - A_{22}) \times (B_{21} + B_{22}) \\ P_7 & = & (A_{11} - A_{21}) \times (B_{11} + B_{12}) \end{array}$  $P_3 = (A_{21} + A_{22}) \times B_{11}$
- . 7 multiplications.
- . 18 = 10 + 8 additions (or subtractions).

Matrix Multiplication: Warmup

### Divide-and-conquer.

- Divide: partition A and B into ½n-by-½n blocks.
- Conquer: multiply 8  $\frac{1}{2}$ n-by- $\frac{1}{2}$ n recursively.
- Combine: add appropriate products using 4 matrix additions.

$$\begin{bmatrix} C_{11} & C_{12} \\ C_{21} & C_{22} \end{bmatrix} = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix} \times \begin{bmatrix} B_{11} & B_{12} \\ B_{21} & B_{22} \end{bmatrix}$$

$$C_{11} = (A_{11} \times B_{11}) + (A_{12} \times B_{21})$$

$$C_{12} = (A_{11} \times B_{12}) + (A_{12} \times B_{22})$$

$$C_{21} = (A_{21} \times B_{11}) + (A_{22} \times B_{21})$$

$$C_{22} = (A_{21} \times B_{12}) + (A_{22} \times B_{22})$$

$$T(n) = \underbrace{8T(n/2)}_{\text{recursive calls}} + \underbrace{\Theta(n^2)}_{\text{add, form submatrices}} \Rightarrow T(n) = \Theta(n^3)$$

### Fast Matrix Multiplication

Fast matrix multiplication. (Strassen, 1969)

- Divide: partition A and B into  $\frac{1}{2}$ n-by- $\frac{1}{2}$ n blocks.
- Compute:  $14\frac{1}{2}$ n-by- $\frac{1}{2}$ n matrices via 10 matrix additions.
- Conquer: multiply  $7\frac{1}{2}$ n-by- $\frac{1}{2}$ n matrices recursively.
- Combine: 7 products into 4 terms using 8 matrix additions.

### Analysis.

- . Assume n is a power of 2.
- T(n) = # arithmetic operations.

$$T(n) = \underbrace{7T(n/2)}_{\text{recursive calls}} + \underbrace{\Theta(n^2)}_{\text{add, subtract}} \Rightarrow T(n) = \Theta(n^{\log_2 7}) = O(n^{2.81})$$

### Fast Matrix Multiplication in Practice

### Implementation issues.

- Sparsity.
- · Caching effects.
- Numerical stability.
- Odd matrix dimensions.
- Crossover to classical algorithm around n = 128.

Common misperception: "Strassen is only a theoretical curiosity."

- Advanced Computation Group at Apple Computer reports 8x speedup on G4 Velocity Engine when n ~ 2,500.
- Range of instances where it's useful is a subject of controversy.

Remark. Can "Strassenize" Ax=b, determinant, eigenvalues, and other matrix ops.

45

### Fast Matrix Multiplication in Theory

Best known. O(n<sup>2.376</sup>) [Coppersmith-Winograd, 1987.]

Conjecture.  $O(n^{2+\epsilon})$  for any  $\epsilon > 0$ .

Caveat. Theoretical improvements to Strassen are progressively less practical.

- 1

### Fast Matrix Multiplication in Theory

- Q. Multiply two 2-by-2 matrices with only 7 scalar multiplications?
- A. Yes! [Strassen, 1969]

- $\Theta(n^{\log_2 7}) = O(n^{2.81})$
- Q. Multiply two 2-by-2 matrices with only 6 scalar multiplications?
- A. Impossible. [Hopcroft and Kerr, 1971]

$$\Theta(n^{\log_2 6}) = O(n^{2.59})$$

- Q. Two 3-by-3 matrices with only 21 scalar multiplications?
- A. Also impossible.

- $\Theta(n^{\log_3 21}) = O(n^{2.77})$
- Q. Two 70-by-70 matrices with only 143,640 scalar multiplications?
- A. Yes! [Pan, 1980]

 $\Theta(n^{\log_{70}143640}) = O(n^{2.80})$ 

### Decimal wars.

- December, 1979: O(n<sup>2.521813</sup>).
- January, 1980: O(n<sup>2.521801</sup>).
