

Introduction to Database Systems CSE 444

Lectures 6-7: Database Design

Magda Balazinska - CSE 444, Fall 2010 1

Outline

- Design theory: 3.1-3.4
 - [Old edition: 3.4-3.6]

Magda Balazinska - CSE 444, Fall 2010 2

Schema Refinements = Normal Forms

- 1st Normal Form = all tables are flat
- 2nd Normal Form = obsolete
- Boyce Codd Normal Form = will study
- 3rd Normal Form = see book

Magda Balazinska - CSE 444, Fall 2010 3

First Normal Form (1NF)

- A database schema is in First Normal Form if all tables are flat

Student

Magda Balazinska - CSE 444, Fall 2010 4

Relational Schema Design

Conceptual Model:

Relational Model:
plus FD's

Normalization:
Eliminates **anomalies**

Magda Balazinska - CSE 444, Fall 2010 5

Data Anomalies

When a database is poorly designed we get anomalies:

- Redundancy:** data is repeated
- Updated anomalies:** need to change in several places
- Delete anomalies:** may lose data when we don't want

Magda Balazinska - CSE 444, Fall 2010 6

Relational Schema Design

Recall set attributes (persons with several phones):

Name	SSN	PhoneNumber	City
Fred	123-45-6789	206-555-1234	Seattle
Fred	123-45-6789	206-555-6543	Seattle
Joe	987-65-4321	908-555-2121	Westfield

One person may have multiple phones, but lives in only one city

Primary key is thus (SSN,PhoneNumber)

The above is in 1NF, but what is the problem with this schema?

Magda Balazinska - CSE 444, Fall 2010

7

Relational Schema Design

Recall set attributes (persons with several phones):

Name	SSN	PhoneNumber	City
Fred	123-45-6789	206-555-1234	Seattle
Fred	123-45-6789	206-555-6543	Seattle
Joe	987-65-4321	908-555-2121	Westfield

Anomalies:

- Redundancy = repeat data
- Update anomalies = what if Fred moves to "Bellevue"?
- Deletion anomalies = what if Joe deletes his phone number? (what if Joe had only one phone #)

Magda Balazinska - CSE 444, Fall 2010

8

Relation Decomposition

Break the relation into two:

Name	SSN	PhoneNumber	City
Fred	123-45-6789	206-555-1234	Seattle
Fred	123-45-6789	206-555-6543	Seattle
Joe	987-65-4321	908-555-2121	Westfield

Name	SSN	City	SSN	PhoneNumber
Fred	123-45-6789	Seattle	123-45-6789	206-555-1234
Joe	987-65-4321	Westfield	123-45-6789	206-555-6543
			987-65-4321	908-555-2121

Anomalies have gone:

- No more repeated data
- Easy to move Fred to "Bellevue" (how ?)
- Easy to delete all Joe's phone numbers (how ?)

9

Relational Schema Design (or Logical Design)

Main idea:

- Start with some relational schema
- Find out its **functional dependencies**
 - They come from the application domain knowledge!
- Use them to design a better relational schema

Magda Balazinska - CSE 444, Fall 2010

10

Functional Dependencies

- A form of constraint
 - Hence, part of the schema
- Finding them is part of the database design
- Use them to normalize the relations

Magda Balazinska - CSE 444, Fall 2010

11

Functional Dependencies (FDs)

Definition:

If two tuples agree on the attributes

A_1, A_2, \dots, A_n

then they must also agree on the attributes

B_1, B_2, \dots, B_m

Formally:

$A_1, A_2, \dots, A_n \rightarrow B_1, B_2, \dots, B_m$

Magda Balazinska - CSE 444, Fall 2010

12

When Does an FD Hold

Definition: $A_1, \dots, A_m \rightarrow B_1, \dots, B_n$ holds in R if:
 $\forall t, t' \in R,$
 $(t.A_1 = t'.A_1 \wedge \dots \wedge t.A_m = t'.A_m \Rightarrow t.B_1 = t'.B_1 \wedge \dots \wedge t.B_n = t'.B_n)$

R	A_1	...	A_m	B_1	...	B_n		
t								
t'								

if t, t' agree here
then t, t' agree here

13

Example

An FD holds, or does not hold on an instance:

EmpID	Name	Phone	Position
E0045	Smith	1234	Clerk
E3542	Mike	9876	Salesrep
E1111	Smith	9876	Salesrep
E9999	Mary	1234	Lawyer

EmpID \rightarrow Name, Phone, Position
 Position \rightarrow Phone
 but not Phone \rightarrow Position

Magda Balazinska - CSE 444, Fall 2010 14

Example

EmpID	Name	Phone	Position
E0045	Smith	1234	Clerk
E3542	Mike	9876	Salesrep
E1111	Smith	9876	Salesrep
E9999	Mary	1234	Lawyer

Position \rightarrow Phone

Magda Balazinska - CSE 444, Fall 2010 15

Example

EmpID	Name	Phone	Position
E0045	Smith	1234	\rightarrow Clerk
E3542	Mike	9876	Salesrep
E1111	Smith	9876	Salesrep
E9999	Mary	1234	\rightarrow Lawyer

But not Phone \rightarrow Position

Magda Balazinska - CSE 444, Fall 2010 16

Example

FD's are constraints:

- On some instances they hold
- On others they don't

$name \rightarrow color$
 $category \rightarrow department$
 $color, category \rightarrow price$

name	category	color	department	price
Gizmo	Gadget	Green	Toys	49
Tweaker	Gadget	Green	Toys	99

Does this instance satisfy all the FDs? 17

Example

$name \rightarrow color$
 $category \rightarrow department$
 $color, category \rightarrow price$

name	category	color	department	price
Gizmo	Gadget	Green	Toys	49
Tweaker	Gadget	Black	Toys	99
Gizmo	Stationary	Green	Office-suppl.	59

What about this one? 18

An Interesting Observation

If all these FDs are true:

$name \rightarrow color$
 $category \rightarrow department$
 $color, category \rightarrow price$

Then this FD also holds:

$name, category \rightarrow price$

Why ??

Magda Balazinska - CSE 444, Fall 2010 19

Goal: Find ALL Functional Dependencies

- Anomalies occur when certain “bad” FDs hold
- We know some of the FDs
- Need to find *all* FDs
- Then look for the bad ones

Magda Balazinska - CSE 444, Fall 2010 20

Armstrong's Rules (1/3)

$A_1, A_2, \dots, A_n \rightarrow B_1, B_2, \dots, B_m$

Splitting rule
and
Combing rule

Is equivalent to

$A_1, A_2, \dots, A_n \rightarrow B_1$
 $A_1, A_2, \dots, A_n \rightarrow B_2$
 \dots
 $A_1, A_2, \dots, A_n \rightarrow B_m$

	A1	...	Am	B1	...	Bm

Magda Balazinska - CSE 444, Fall 2010 21

Armstrong's Rules (2/3)

$A_1, A_2, \dots, A_n \rightarrow A_i$

Trivial Rule

where $i = 1, 2, \dots, n$

Why ?

	A1	...	Am			

Magda Balazinska - CSE 444, Fall 2010 22

Armstrong's Rules (3/3)

Transitive Rule

If $A_1, A_2, \dots, A_n \rightarrow B_1, B_2, \dots, B_m$

and $B_1, B_2, \dots, B_m \rightarrow C_1, C_2, \dots, C_p$

then $A_1, A_2, \dots, A_n \rightarrow C_1, C_2, \dots, C_p$

Why ?

Magda Balazinska - CSE 444, Fall 2010 23

Armstrong's Rules (3/3)

Illustration

	A1	...	Am	B1	...	Bm	C1	...	Cp

Magda Balazinska - CSE 444, Fall 2010 24

Example (continued)

Start from the following FDs:

1. name → color
 2. category → department
 3. color, category → price

Infer the following FDs:

Inferred FD	Which Rule did we apply ?
4. name, category → name	
5. name, category → color	
6. name, category → category	
7. name, category → color, category	
8. name, category → price	

25

Example (continued)

Answers:

1. name → color
 2. category → department
 3. color, category → price

Inferred FD	Which Rule did we apply ?
4. name, category → name	Trivial rule
5. name, category → color	Transitivity on 4, 1
6. name, category → category	Trivial rule
7. name, category → color, category	Split/combine on 5, 6
8. name, category → price	Transitivity on 3, 7

THIS IS TOO HARD ! Let's see an easier way. 26

Closure of a set of Attributes

Given a set of attributes A_1, \dots, A_n

The **closure**, $\{A_1, \dots, A_n\}^+$ = the set of attributes B s.t. $A_1, \dots, A_n \rightarrow B$

Example:

name → color
 category → department
 color, category → price

Closures:

name⁺ = {name, color}
 {name, category}⁺ = {name, category, color, department, price}
 color⁺ = {color}

Magda Balazinska - CSE 444, Fall 2010 27

Closure Algorithm

$X = \{A_1, \dots, A_n\}$.

Repeat until X doesn't change do:
 if $B_1, \dots, B_n \rightarrow C$ is a FD and B_1, \dots, B_n are all in X
 then add C to X.

Example:

name → color
 category → department
 color, category → price

$\{name, category\}^+ =$
 { name, category, color, department, price }

Hence: name, category → color, department, price

Magda Balazinska - CSE 444, Fall 2010 28

Example

In class:

R(A,B,C,D,E,F)

A, B → C
 A, D → E
 B → D
 A, F → B

Compute {A,B}⁺ X = {A, B, }

Compute {A, F}⁺ X = {A, F, }

Magda Balazinska - CSE 444, Fall 2010 29

Example

In class:

R(A,B,C,D,E,F)

A, B → C
 A, D → E
 B → D
 A, F → B

Compute {A,B}⁺ X = {A, B, C, D, E }

Compute {A, F}⁺ X = {A, F, }

Magda Balazinska - CSE 444, Fall 2010 30

Example

In class:

$R(A,B,C,D,E,F)$

A, B	→	C
A, D	→	E
B	→	D
A, F	→	B

Compute $\{A,B\}^+$ $X = \{A, B, C, D, E\}$

Compute $\{A, F\}^+$ $X = \{A, F, B, C, D, E\}$

Magda Balazinska - CSE 444, Fall 2010 31

Why Do We Need Closure

- With closure we can find all FD's easily
- To check if $X \rightarrow A$
 - Compute X^+
 - Check if $A \in X^+$

Magda Balazinska - CSE 444, Fall 2010 32

Using Closure to Infer ALL FDs

Example:

A, B	→	C
A, D	→	B
B	→	D

Step 1: Compute X^+ , for every X:

$A^+ = A, B^+ = BD, C^+ = C, D^+ = D$
$AB^+ = ABCD, AC^+ = AC, AD^+ = ABCD,$
$BC^+ = BCD, BD^+ = BD, CD^+ = CD$
$ABC^+ = ABD^+ = ACD^+ = ABCD$ (no need to compute- why ?)
$BCD^+ = BCD, ABCD^+ = ABCD$

Step 2: Enumerate all FD's $X \rightarrow Y$, s.t. $Y \subseteq X^+$ and $X \cap Y = \emptyset$:

$AB \rightarrow CD, AD \rightarrow BC, BC \rightarrow D, ABC \rightarrow D, ABD \rightarrow C, ACD \rightarrow B$

33

Another Example

- Enrollment(student, major, course, room, time)
 - student → major
 - major, course → room
 - course → time

What else can we infer ? [in class, or at home]

Magda Balazinska - CSE 444, Fall 2010 34

Keys

- A **superkey** is a set of attributes A_1, \dots, A_n s.t. for any other attribute B, we have $A_1, \dots, A_n \rightarrow B$
- A **key** is a minimal superkey
 - I.e. set of attributes which is a superkey and for which no subset is a superkey

Magda Balazinska - CSE 444, Fall 2010 35

Computing (Super)Keys

- Compute X^+ for all sets X
- If $X^+ =$ all attributes, then X is a superkey
- List only the minimal X's to get the keys

Magda Balazinska - CSE 444, Fall 2010 36

Example

Product(name, price, category, color)

name, category → price
category → color

What is the key ?

Magda Balazinska - CSE 444, Fall 2010 37

Example

Product(name, price, category, color)

name, category → price
category → color

What is the key ?

(name, category) + = { name, category, price, color }

Hence (name, category) is a key

Magda Balazinska - CSE 444, Fall 2010 38

Examples of Keys

Enrollment(student, address, course, room, time)

student → address
room, time → course
student, course → room, time

(find keys at home)

Magda Balazinska - CSE 444, Fall 2010 39

Eliminating Anomalies

Main idea:

- $X \rightarrow A$ is OK if X is a (super)key
- $X \rightarrow A$ is not OK otherwise

Magda Balazinska - CSE 444, Fall 2010 40

Example

Name	SSN	PhoneNumber	City
Fred	123-45-6789	206-555-1234	Seattle
Fred	123-45-6789	206-555-6543	Seattle
Joe	987-65-4321	908-555-2121	Westfield
Joe	987-65-4321	908-555-1234	Westfield

SSN → Name, City

What is the key?

{SSN, PhoneNumber} Hence SSN → Name, City is a "bad" dependency

Magda Balazinska - CSE 444, Fall 2010 41

Key or Keys ?

Can we have more than one key ?

Given R(A,B,C) define FD's s.t. there are two or more keys

Magda Balazinska - CSE 444, Fall 2010 42

Key or Keys ?

Can we have more than one key ?

Given $R(A,B,C)$ define FD's s.t. there are two or more keys

what are the keys here ?

Can you design FDs such that there are *three* keys ?

Boyce-Codd Normal Form

A simple condition for removing anomalies from relations:

A relation R is in BCNF if:

If $A_1, \dots, A_n \rightarrow B$ is a non-trivial dependency in R , then $\{A_1, \dots, A_n\}$ is a superkey for R

In other words: there are no "bad" FDs

Equivalently:

for all X , either $(X^+ = X)$ or $(X^+ = \text{all attributes})$

BCNF Decomposition Algorithm

repeat

choose $A_1, \dots, A_m \rightarrow B_1, \dots, B_n$ that violates BCNF
 split R into $R_1(A_1, \dots, A_m, B_1, \dots, B_n)$ and $R_2(A_1, \dots, A_m, [\text{others}])$
 continue with both R_1 and R_2

until no more violations

Is there a 2-attribute relation that is not in BCNF ?

In practice, we have a better algorithm (coming up)

Example

Name	SSN	PhoneNumber	City
Fred	123-45-6789	206-555-1234	Seattle
Fred	123-45-6789	206-555-6543	Seattle
Joe	987-65-4321	908-555-2121	Westfield
Joe	987-65-4321	908-555-1234	Westfield

$SSN \rightarrow \text{Name, City}$

What is the key?

$\{SSN, \text{PhoneNumber}\}$ use $SSN \rightarrow \text{Name, City}$ to split

Example

Name	SSN	City
Fred	123-45-6789	Seattle
Joe	987-65-4321	Westfield

$SSN \rightarrow \text{Name, City}$

SSN	PhoneNumber
123-45-6789	206-555-1234
123-45-6789	206-555-6543
987-65-4321	908-555-2121
987-65-4321	908-555-1234

Let's check anomalies:

- Redundancy ?
- Update ?
- Delete ?

Example Decomposition

$\text{Person}(\text{name, SSN, age, hairColor, phoneNumber})$

FD1: $SSN \rightarrow \text{name, age}$

FD2: $\text{age} \rightarrow \text{hairColor}$

Decompose in BCNF (in class):

Example Decomposition

Person(name, SSN, age, hairColor, phoneNumber)
 FD1: SSN → name, age
 FD2: age → hairColor

Decompose in BCNF (in class): What is the key?
 {SSN, phoneNumber}

But how to decompose?
 Person(SSN, name, age)
 Phone(SSN, hairColor, phoneNumber)
 Or
 Person(SSN, name, age, hairColor)
 Phone(SSN, phoneNumber)
 Or

Magda Balazinska - CSE 444, Fall 2010 49

BCNF Decomposition Algorithm

BCNF_Decompose(R)

find X s.t.: $X \neq X^+ \neq$ [all attributes]

if (not found) **then** "R is in BCNF"

let $Y = X^+ - X$
let $Z =$ [all attributes] - X^+
 decompose R into $R_1(X \cup Y)$ and $R_2(X \cup Z)$
 continue to decompose recursively R_1 and R_2

Magda Balazinska - CSE 444, Fall 2010 50

Find X s.t.: $X \neq X^+ \neq$ [all attributes]

Example BCNF Decomposition

Person(name, SSN, age, hairColor, phoneNumber)
 SSN → name, age
 age → hairColor

Iteration 1: Person
 SSN+ = SSN, name, age, hairColor
 Decompose into: P(SSN, name, age, hairColor)
 Phone(SSN, phoneNumber)

What are the keys ?

Iteration 2: P
 age+ = age, hairColor
 Decompose: People(SSN, name, age)
 Hair(age, hairColor)
 Phone(SSN, phoneNumber)

51

R(A,B,C,D)

A → B
B → C

Example

What happens if in R we first pick B^+ ? Or AB^+ ?

52

Decompositions in General

$R(A_1, \dots, A_n, B_1, \dots, B_m, C_1, \dots, C_p)$

$R_1(A_1, \dots, A_n, B_1, \dots, B_m)$

$R_2(A_1, \dots, A_n, C_1, \dots, C_p)$

R_1 = projection of R on $A_1, \dots, A_n, B_1, \dots, B_m$
 R_2 = projection of R on $A_1, \dots, A_n, C_1, \dots, C_p$

Magda Balazinska - CSE 444, Fall 2010 53

Theory of Decomposition

- Sometimes it is correct:

Name	Price	Category
Gizmo	19.99	Gadget
OneClick	24.99	Camera
Gizmo	19.99	Camera

Name	Price
Gizmo	19.99
OneClick	24.99
Gizmo	19.99

Name	Category
Gizmo	Gadget
OneClick	Camera
Gizmo	Camera

Lossless decomposition

54

Incorrect Decomposition

- Sometimes it is not:

Name	Price	Category
Gizmo	19.99	Gadget
OneClick	24.99	Camera
Gizmo	19.99	Camera

What's incorrect ??

Name	Category
Gizmo	Gadget
OneClick	Camera
Gizmo	Camera

Price	Category
19.99	Gadget
24.99	Camera
19.99	Camera

Lossy decomposition 55

Decompositions in General

$R(A_1, \dots, A_n, B_1, \dots, B_m, C_1, \dots, C_p)$

$R_1(A_1, \dots, A_n, B_1, \dots, B_m)$

$R_2(A_1, \dots, A_n, C_1, \dots, C_p)$

If $A_1, \dots, A_n \rightarrow B_1, \dots, B_m$
 Then the decomposition is lossless

Note: don't need $A_1, \dots, A_n \rightarrow C_1, \dots, C_p$

BCNF decomposition is always lossless. WHY ?

Optional

- The following four slides are optional
- The content will not be on any exam
- But please take a look because they motivate the need for 3NF
- It's good to know at least why 3NF exists

Magda Balazinska - CSE 444, Fall 2010 57

General Decomposition Goals

- Elimination of anomalies
- Recoverability of information
 - Can we get the original relation back?
- Preservation of dependencies
 - Want to enforce FDs without performing joins

Sometimes cannot decomposed into BCNF without losing ability to check some FDs

BCNF and Dependencies

Unit	Company	Product

FD's: $Unit \rightarrow Company$; $Company, Product \rightarrow Unit$
 So, there is a BCNF violation, and we decompose.

Unit	Company

$Unit \rightarrow Company$

Unit	Product

No FDs

Magda Balazinska - CSE 444, Fall 2010 59

BCNF and Dependencies

Unit	Company	Product

FD's: $Unit \rightarrow Company$; $Company, Product \rightarrow Unit$
 So, there is a BCNF violation, and we decompose.

Unit	Company

$Unit \rightarrow Company$

Unit	Product

No FDs

In BCNF we lose the FD: $Company, Product \rightarrow Unit$

Magda Balazinska - CSE 444, Fall 2010 60

3NF Motivation

A relation R is in 3rd normal form if :

Whenever there is a nontrivial dep. $A_1, A_2, \dots, A_n \rightarrow B$ for R ,
then $\{A_1, A_2, \dots, A_n\}$ is a super-key for R ,
or B is part of a key.

Tradeoffs

BCNF = no anomalies, but may lose some FDs

3NF = keeps all FDs, but may have some anomalies
