

Introduction to Database Systems

CSE 444

Lecture 18: Relational Algebra

Outline

- Motivation and sets v.s. bags
- Relational Algebra
- Translation from SQL to the Relational Algebra

- Read Sections 2.4, 5.1, and 5.2
 - [Old edition: 5.1 through 5.4]
 - These book sections go over relational operators

The WHAT and the HOW

- In SQL, we write **WHAT** we want to get from the data
- The database system needs to figure out **HOW** to get the data we want
- The passage from **WHAT** to **HOW** goes through the **Relational Algebra**

SQL = WHAT

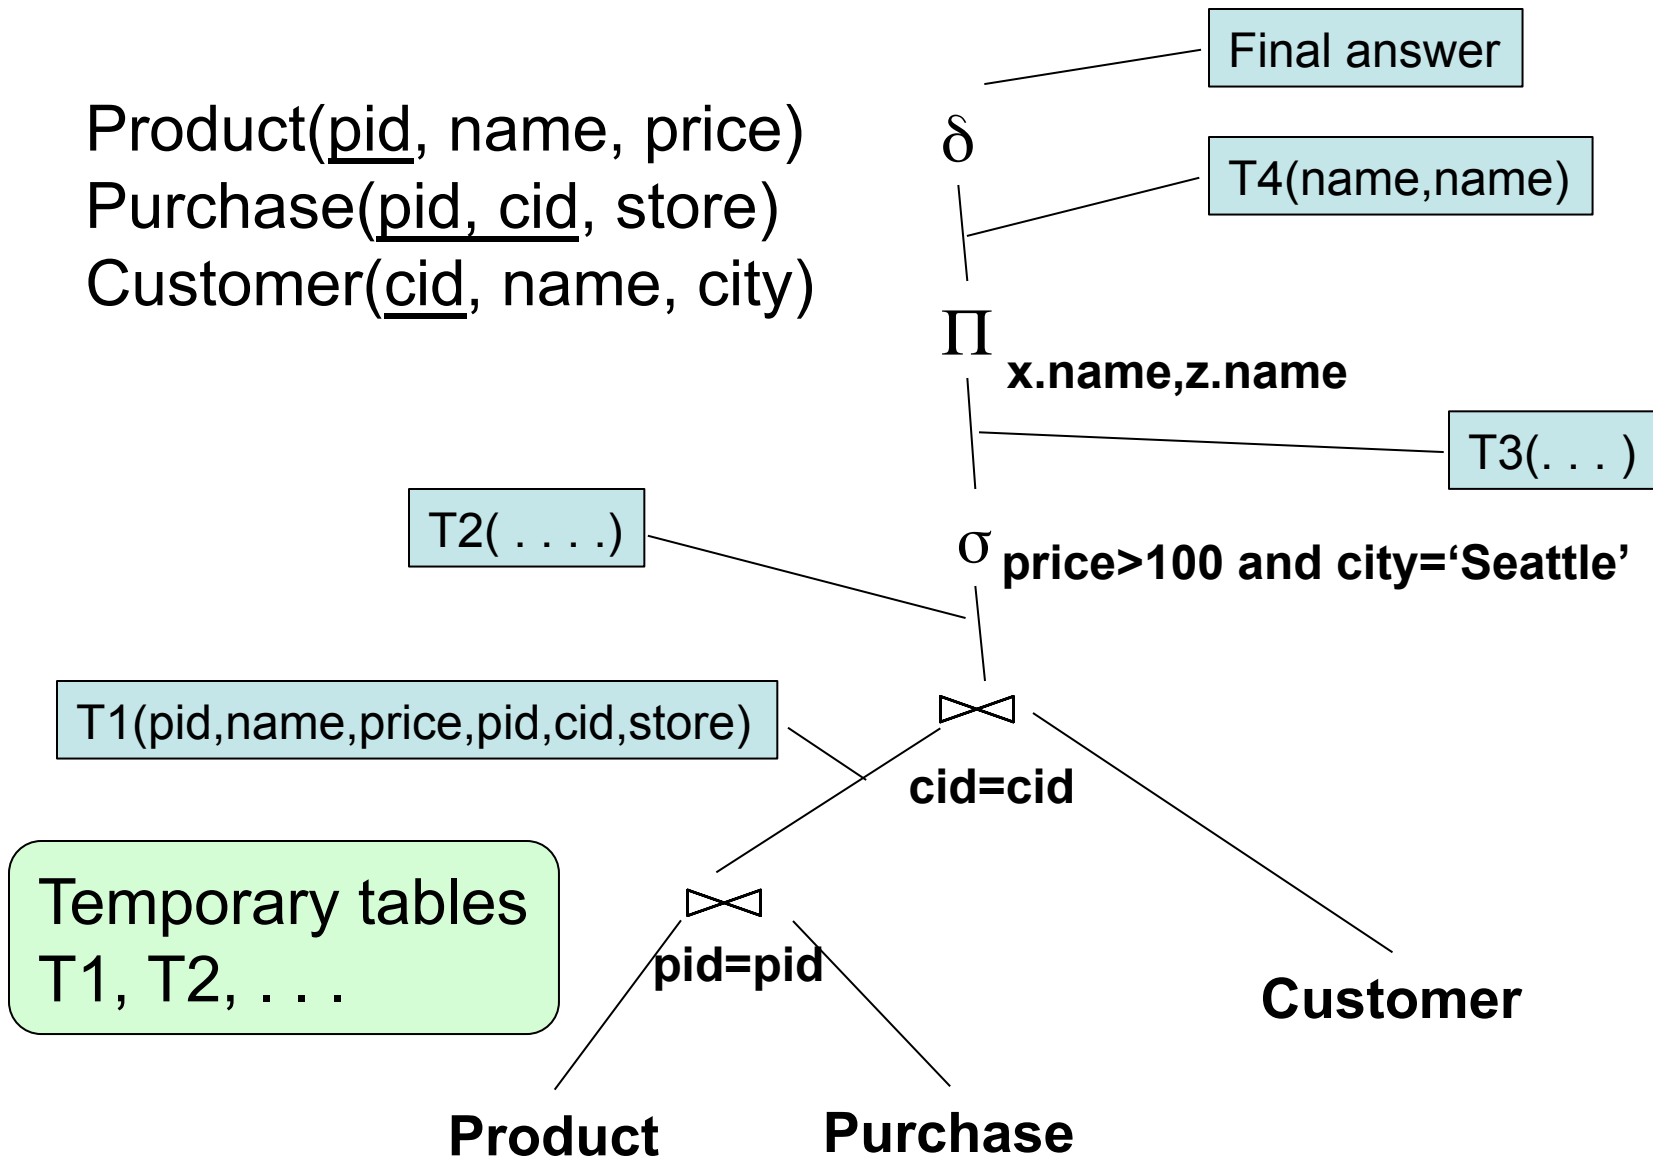

Product(pid, name, price)
Purchase(pid, cid, store)
Customer(cid, name, city)

```
SELECT DISTINCT x.name, z.name  
FROM Product x, Purchase y, Customer z  
WHERE x.pid = y.pid and y.cid = z.cid and  
       x.price > 100 and z.city = 'Seattle'
```

It's clear WHAT we want, unclear HOW to get it

Relational Algebra = HOW

Product(pid, name, price)
 Purchase(pid, cid, store)
 Customer(cid, name, city)

Relational Algebra = HOW

The order is now clearly specified:

- Iterate over PRODUCT...
- ...join with PURCHASE...
- ...join with CUSTOMER...
- ...select tuples with Price>100 and City='Seattle'...
- ...eliminate duplicates...
- ...and that's the final answer !

Relations

- A relation is a set of tuples
 - Sets: {a,b,c}, {a,d,e,f}, { }, . . .
- But, commercial DBMS's implement **relations that are bags** rather than sets
 - Bags: {a, a, b, c}, {b, b, b, b, b}, . . .

Sets v.s. Bags

Relational Algebra has two flavors:

- **Over sets**: theoretically elegant but limited
- **Over bags**: needed for SQL queries + more efficient
 - Example: Compute average price of all products

We discuss set semantics

- We mention bag semantics only where needed

Outline

- Motivation and sets v.s. bags
- Relational Algebra
- Translation from SQL to the Relational Algebra

- Read Sections 2.4, 5.1, and 5.2
 - [Old edition: 5.1 through 5.4]
 - These book sections go over relational operators

Relational Algebra

- **Query language** associated with relational model
- **Queries specified in an operational manner**
 - A query gives a step-by-step procedure
- **Relational operators**
 - Take one or two relation instances as argument
 - Return one relation instance as result
 - Easy to **compose** into **relational algebra expressions**

Relational Algebra (1/3)

Five basic operators:

- **Union** (\cup) and **Set difference** ($-$)
- **Selection**: $\sigma_{\text{condition}}(\mathcal{S})$
 - Condition is Boolean combination (\wedge, \vee) of terms
 - Term is: attribute op constant, attr. op attr.
 - Op is: $<$, \leq , $=$, \neq , \geq , or $>$
- **Projection**: $\pi_{\text{list-of-attributes}}(\mathcal{S})$
- **Cross-product** or **cartesian product** (\times)

Relational Algebra (2/3)

Derived or auxiliary operators:

- **Intersection** (\cap), **Division** (R/S)
- **Join**: $R \bowtie_{\theta} S = \sigma_{\theta}(R \times S)$
- Variations of joins
 - Natural, equijoin, theta-join
 - Outer join and semi-join
- **Rename** $\rho_{B_1, \dots, B_n}(S)$

Relational Algebra (3/3)

Extensions for bags

- Duplicate elimination: δ
- Group by: γ [Same symbol as aggregation]
 - Partitions tuples of a relation into “groups”
- Sorting: τ

Other extensions

- Aggregation: γ (min, max, sum, average, count)

Union and Difference

- $R1 \cup R2$
- Example:
 - ActiveEmployees \cup RetiredEmployees
- $R1 - R2$
- Example:
 - AllEmployees – RetiredEmployees

Be careful when applying to bags!

What about Intersection ?

- It is a derived operator
- $R1 \cap R2 = R1 - (R1 - R2)$
- Also expressed as a join (will see later)
- Example
 - `UnionizedEmployees` \cap `RetiredEmployees`

Relational Algebra (1/3)

Five basic operators:

- **Union** (\cup) and **Set difference** ($-$)
- **Selection**: $\sigma_{\text{condition}}(\mathbf{S})$
 - Condition is Boolean combination (\wedge, \vee) of terms
 - Term is: attribute op constant, attr. op attr.
 - Op is: $<$, \leq , $=$, \neq , \geq , or $>$
- **Projection**: $\pi_{\text{list-of-attributes}}(\mathbf{S})$
- **Cross-product** or **cartesian product** (\times)

Selection

- Returns all tuples that satisfy a condition
- Notation: $\sigma_c(R)$
- Examples
 - $\sigma_{\text{Salary} > 40000}(\text{Employee})$
 - $\sigma_{\text{name} = \text{"Smith"}}(\text{Employee})$
- The condition c can be
 - Boolean combination (\wedge, \vee) of terms
 - Term is: attribute op constant, attr. op attr.
 - Op is: $<$, \leq , $=$, \neq , \geq , or $>$

SSN	Name	Salary
1234545	John	200000
5423341	Smith	600000
4352342	Fred	500000

$\sigma_{\text{Salary} > 40000}$ (Employee)

SSN	Name	Salary
5423341	Smith	600000
4352342	Fred	500000

Projection

- Eliminates columns
- Notation: $\Pi_{A_1, \dots, A_n}(R)$
- Example: project social-security number and names:
 - $\Pi_{SSN, Name}(\text{Employee})$
 - Output schema: Answer(SSN, Name)

Semantics differs over set or over bags

SSN	Name	Salary
1234545	John	200000
5423341	John	600000
4352342	John	200000

$\Pi_{\text{Name,Salary}}$ (Employee)

Name	Salary
John	20000
John	60000

Set semantics: duplicate elimination automatic

SSN	Name	Salary
1234545	John	200000
5423341	John	600000
4352342	John	200000

$\Pi_{\text{Name,Salary}}(\text{Employee})$

Name	Salary
John	20000
John	60000
John	20000

Bag semantics: no duplicate elimination; need explicit δ

Selection & Projection Examples

Patient

no	name	zip	disease
1	p1	98125	flu
2	p2	98125	heart
3	p3	98120	lung
4	p4	98120	heart

$\pi_{\text{zip,disease}}(\text{Patient})$

zip	disease
98125	flu
98125	heart
98120	lung
98120	heart

$\sigma_{\text{disease='heart'}}(\text{Patient})$

no	name	zip	disease
2	p2	98125	heart
4	p4	98120	heart

$\pi_{\text{zip}}(\sigma_{\text{disease='heart'}}(\text{Patient}))$

zip
98120
98125

Relational Algebra (1/3)

Five basic operators:

- **Union** (\cup) and **Set difference** ($-$)
- **Selection**: $\sigma_{\text{condition}}(\mathcal{S})$
 - Condition is Boolean combination (\wedge, \vee) of terms
 - Term is: attribute op constant, attr. op attr.
 - Op is: $<$, \leq , $=$, \neq , \geq , or $>$
- **Projection**: $\pi_{\text{list-of-attributes}}(\mathcal{S})$
- **Cross-product** or **cartesian product** (\times)

Cartesian Product

- Each tuple in R1 with each tuple in R2
- Notation: $R1 \times R2$
- Example:
 - Employee \times Dependents
- Rare in practice; mainly used to express joins

Cartesian Product Example

Employee

Name	SSN
John	999999999
Tony	777777777

Dependents

EmployeeSSN	Dname
999999999	Emily
777777777	Joe

Employee x Dependents

Name	SSN	EmployeeSSN	Dname
John	999999999	999999999	Emily
John	999999999	777777777	Joe
Tony	777777777	999999999	Emily
Tony	777777777	777777777	Joe

Relational Algebra (2/3)

Derived or auxiliary operators:

- **Intersection** (\cap), **Division** (R/S)
- **Join**: $R \bowtie_{\theta} S = \sigma_{\theta}(R \times S)$
- Variations of joins
 - Natural, equijoin, theta-join
 - Outer join and semi-join
- **Rename** $\rho_{B_1, \dots, B_n}(S)$

Renaming

- Changes the schema, not the instance
- Notation: $\rho_{B_1, \dots, B_n}(R)$
- Example:
 - $\rho_{\text{LastName}, \text{SocSocNo}}(\text{Employee})$
 - Output schema:
Answer(LastName, SocSocNo)

Renaming Example

Employee

Name	SSN
John	999999999
Tony	777777777

$\rho_{\text{LastName, SocSocNo}}$ (**Employee**)

LastName	SocSocNo
John	999999999
Tony	777777777

Relational Algebra (2/3)

Derived or auxiliary operators:

- **Intersection** (\cap), **Division** (R/S)
- **Join**: $R \bowtie_{\theta} S = \sigma_{\theta}(R \times S)$
- Variations of joins
 - Natural, equijoin, theta-join
 - Outer join and semi-join
- **Rename** $\rho_{B_1, \dots, B_n}(S)$

Different Types of Join

- **Theta-join:** $R \bowtie_{\theta} S = \sigma_{\theta}(R \times S)$
 - Join of R and S with a join condition θ
 - Cross-product followed by selection θ
- **Equijoin:** $R \bowtie_{\theta} S = \pi_A (\sigma_{\theta}(R \times S))$
 - Join condition θ consists only of equalities
 - Projection π_A drops all redundant attributes
- **Natural join:** $R \bowtie S = \pi_A (\sigma_{\theta}(R \times S))$
 - Equijoin
 - Equality on **all** fields with same name in R and in S

Theta-Join Example

AnonPatient P

age	zip	disease
54	98125	heart
20	98120	flu

AnnonJob J

job	age	zip
lawyer	54	98125
cashier	20	98120

$$P \bowtie_{P.age=J.age \wedge P.zip=J.zip \wedge P.age < 50} J$$

P.age	P.zip	disease	job	J.age	J.zip
20	98120	flu	cashier	20	98120

Equijoin Example

AnonPatient P

age	zip	disease
54	98125	heart
20	98120	flu

AnnonJob J

job	age	zip
lawyer	54	98125
cashier	20	98120

$P \bowtie_{P.age=J.age} J$

age	P.zip	disease	job	J.zip
54	98125	heart	lawyer	98125
20	98120	flu	cashier	98120

Natural Join Example

AnonPatient P

age	zip	disease
54	98125	heart
20	98120	flu

AnnonJob J

job	age	zip
lawyer	54	98125
cashier	20	98120

$P \bowtie J$

age	zip	disease	job
54	98125	heart	lawyer
20	98120	flu	cashier

So Which Join Is It ?

- When we write $R \bowtie S$ we usually mean an equijoin, but we often omit the equality predicate when it is clear from the context

More Joins

- **Outer join**
 - Include tuples with no matches in the output
 - Use NULL values for missing attributes
- Variants
 - Left outer join
 - Right outer join
 - Full outer join

Outer Join Example

AnonPatient P

age	zip	disease
54	98125	heart
20	98120	flu
33	98120	lung

AnnonJob J

job	age	zip
lawyer	54	98125
cashier	20	98120

P \bowtie V

age	zip	disease	job
54	98125	heart	lawyer
20	98120	flu	cashier
33	98120	lung	null

Semijoin

- $R \bowtie S = \Pi_{A_1, \dots, A_n} (R \bowtie S)$
- Where A_1, \dots, A_n are the attributes in R
- Example:
 - Employee \bowtie Dependents

Semijoins in Distributed Databases

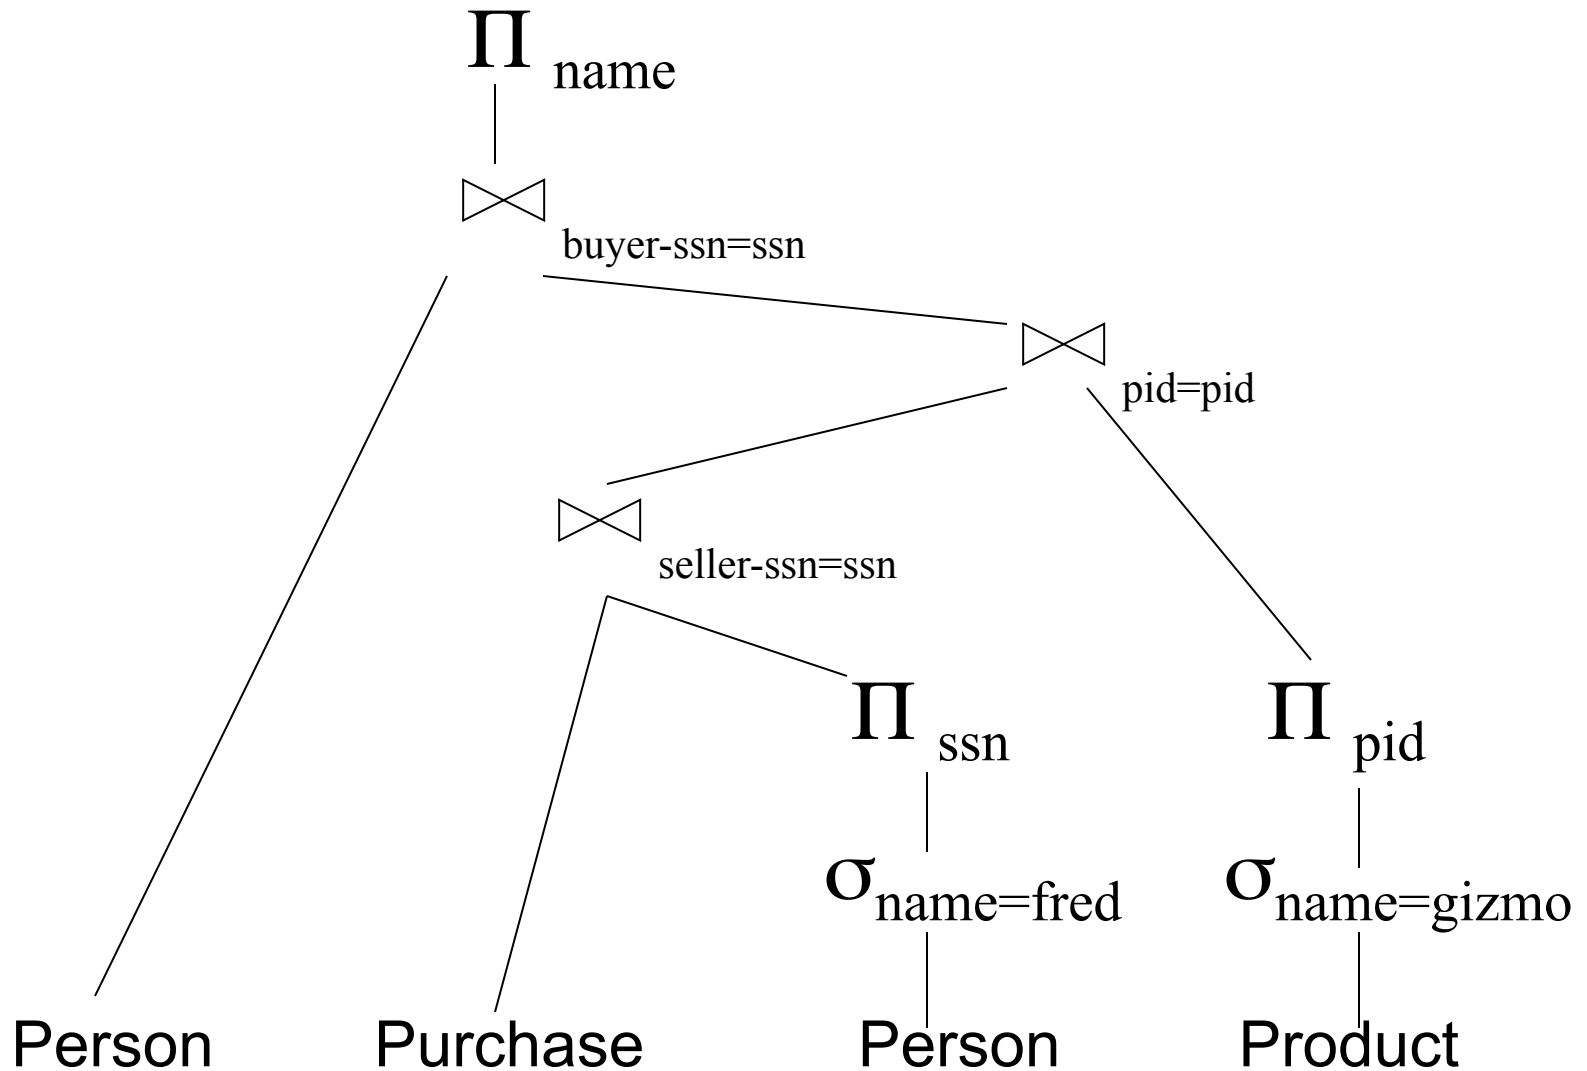

- Semijoins are used in distributed databases

$\text{Employee} \bowtie_{\text{ssn}=\text{ssn}} (\sigma_{\text{age}>71} (\text{Dependents}))$

$R = \text{Employee} \bowtie T$
 $T = \Pi_{\text{SSN}} (\sigma_{\text{age}>71} (\text{Dependents}))$
 $\text{Answer} = R \bowtie \text{Dependents}$

Complex RA Expressions

Example of Algebra Queries

Q1: Jobs of patients who have heart disease

$\pi_{\text{job}}(\text{AnnonJob} \bowtie (\sigma_{\text{disease}='heart'}(\text{AnonPatient})))$

More Examples

Supplier(sno, sname, scity, sstate)

Part(pno, pname, psize, pcolor)

Supply(sno, pno, qty, price)

Q2: Name of supplier of parts with size greater than 10

$\pi_{\text{sname}}(\text{Supplier} \bowtie \text{Supply} \bowtie (\sigma_{\text{psize} > 10}(\text{Part})))$

Q3: Name of supplier of red parts or parts with size greater than 10

$\pi_{\text{sname}}(\text{Supplier} \bowtie \text{Supply} \bowtie (\sigma_{\text{psize} > 10}(\text{Part}) \cup \sigma_{\text{pcolor} = \text{'red'}}(\text{Part})))$

RA Expressions v.s. Programs

- An Algebra Expression is like a program
 - Several operations
 - Strictly specified order
- But Algebra expressions have limitations

RA and Transitive Closure

- Cannot compute “transitive closure”

Name1	Name2	Relationship
Fred	Mary	Father
Mary	Joe	Cousin
Mary	Bill	Spouse
Nancy	Lou	Sister

- Find all direct and indirect relatives of Fred
- Cannot express in RA !!! Need to write Java program

Outline

- Motivation and sets v.s. bags
- Relational Algebra
- Translation from SQL to the Relational Algebra
- Read Sections 2.4, 5.1, and 5.2
 - [Old edition: 5.1 through 5.4]
 - These book sections go over relational operators

From SQL to RA

Product(pid, name, price)

Purchase(pid, cid, store)

Customer(cid, name, city)

```
SELECT DISTINCT x.name, z.name  
FROM Product x, Purchase y, Customer z  
WHERE x.pid = y.pid and y.cid = z.cid and  
       x.price > 100 and z.city = 'Seattle'
```

From SQL to RA

An Equivalent Expression

Query optimization =
finding cheaper
equivalent
expressions

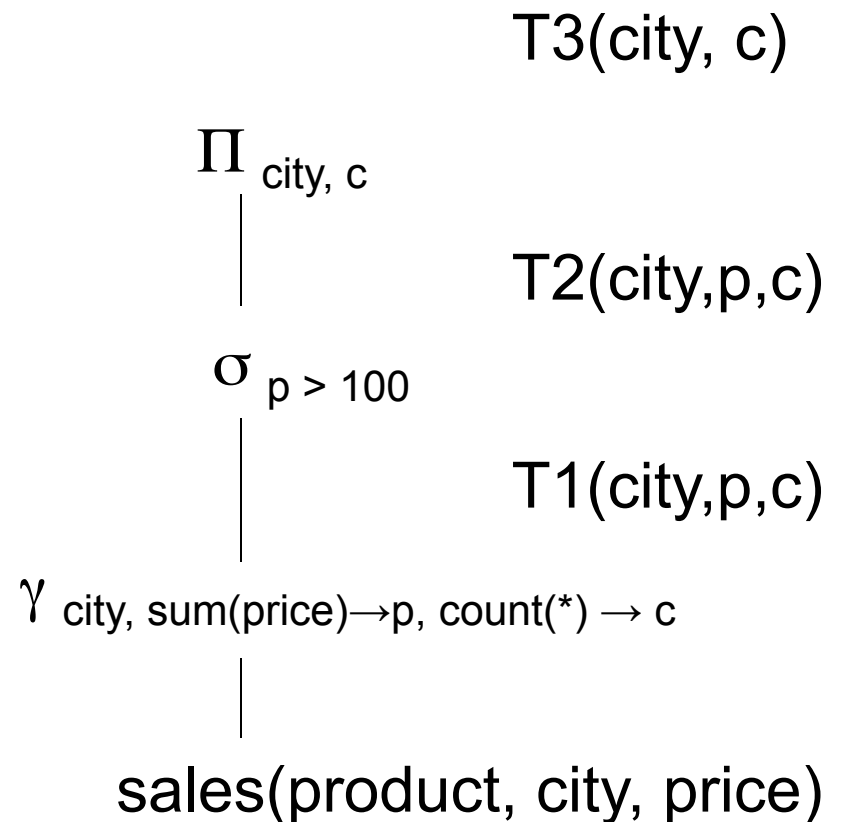

Operators on Bags

- Duplicate elimination δ
- Grouping γ
- Sorting τ

Logical Query Plan

```
SELECT city, count(*)  
FROM sales  
GROUP BY city  
HAVING sum(price) > 100
```

T1, T2, T3 = temporary tables

Non-monotone Queries (at home !)

Product(pid, name, price)
Purchase(pid, cid, store)
Customer(cid, name, city)

```
SELECT DISTINCT z.store
FROM Customer z
WHERE z.city='Seattle' AND
      not exists (select *
                  from Product x, Purchase y
                  where x.pid= y.pid
                       and y.cid = z.cid
                       and x.price < 100)
```
